Texas Instruments OMAP™ Family of Products

Version K

## Technical Reference Manual

Literature Number: SWPU231K  
July 2010–Revised September 2010

## **WARNING: EXPORT NOTICE**

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

# Contents

<b>Preface</b> .....	<b>245</b>
<b>1 Introduction</b> .....	<b>255</b>
1.1 Overview .....	256
1.2 Environment .....	257
1.3 Description .....	258
1.3.1 Cortex-A9 MPU Subsystem Description .....	260
1.3.2 IVA-HD Subsystem Description .....	260
1.3.3 Cortex-M3 MPU Subsystem Description .....	261
1.3.4 Display Subsystem Description .....	261
1.3.5 ABE Subsystem Description .....	262
1.3.6 ISS Description .....	263
1.3.7 2D/3D Graphics Accelerator Description .....	264
1.3.8 Face Detect Module Description .....	264
1.3.9 On-Chip Debug Support Description .....	264
1.3.10 Power, Reset, and Clock Management Description .....	265
1.3.11 On-Chip Memory Description .....	266
1.3.12 Memory Management Description .....	266
1.3.13 External Memory Interface Description .....	266
1.3.14 System and Connection Peripherals .....	266
1.3.14.1 System Peripherals .....	266
1.3.14.2 Connection Peripherals .....	267
1.4 Package-On-Package Concept .....	268
1.5 Device Identification .....	269
<b>2 Memory Mapping</b> .....	<b>271</b>
2.1 Introduction .....	272
2.2 L3 Memory Space Mapping .....	274
2.2.1 L3_EMU Memory Space Mapping .....	276
2.3 L4 Memory Space Mapping .....	277
2.3.1 L4_CFG Memory Space Mapping .....	277
2.3.2 L4_WKUP Memory Space Mapping .....	279
2.3.3 L4_PER Memory Space Mapping .....	280
2.3.4 L4_ABE Memory Space Mapping .....	282
2.4 Dual Cortex-M3 Subsystem Memory Space Mapping .....	286
2.5 DSP Subsystem Memory Space Mapping .....	287
2.6 Display Subsystem Memory Space Mapping .....	289
2.6.1 L3 Interconnect View of the Display Memory Space .....	289
2.6.2 L4 Interconnect View of the Display Memory Space .....	289
<b>3 Power, Reset and Clock Management</b> .....	<b>291</b>
3.1 Device Power Management Introduction .....	292
3.1.1 Device Power-Management Architecture Building Blocks .....	292
3.1.1.1 Clock Management .....	292
3.1.1.1.1 Module Interface and Functional Clocks .....	292
3.1.1.1.2 Module-Level Clock Management .....	293

3.1.1.1.3	Clock Domain .....	298
3.1.1.1.4	Clock Domain-Level Clock Management .....	299
3.1.1.1.5	Clock Domain HW_AUTO Mode Sequences .....	300
3.1.1.1.6	Clock Domain Sleep/Wakeup .....	303
3.1.1.1.7	Clock Domain Dependency .....	304
3.1.1.2	Power Management .....	307
3.1.1.2.1	Power Domain .....	307
3.1.1.2.2	Module Logic and Memory Context .....	308
3.1.1.2.3	Retention-Till-Access Memory Feature .....	309
3.1.1.2.4	Power Domain Management .....	309
3.1.1.3	Voltage Management .....	310
3.1.1.3.1	Voltage Domain .....	311
3.1.1.3.2	Voltage Domain Management .....	312
3.1.1.3.3	AVS Overview .....	313
3.1.2	Power-Management Techniques .....	315
3.1.2.1	Standby Leakage Management .....	315
3.1.2.2	Dynamic Voltage and Frequency Scaling .....	316
3.1.2.3	Dynamic Power Switching .....	316
3.1.2.4	Adaptive Voltage Scaling .....	317
3.1.2.5	Adaptive Body Bias .....	318
3.1.2.6	Combining Power-Management Techniques .....	318
3.1.2.6.1	DPS Versus SLM .....	319
3.2	PRCM Subsystem Overview .....	320
3.2.1	Introduction .....	320
3.2.2	Power-Management Framework Features .....	321
3.3	PRCM Subsystem Environment .....	322
3.3.1	External Clock Signals .....	322
3.3.2	External Reset Signals .....	323
3.3.3	External Power Control Signals .....	323
3.3.4	External Voltage Inputs .....	324
3.4	PRCM Subsystem Integration .....	325
3.4.1	Device Power-Management Layout .....	325
3.4.2	Power-Management Scheme, Reset, and Interrupt Requests .....	327
3.4.2.1	Power Domain .....	327
3.4.2.2	Resets .....	328
3.4.2.3	Interrupt Requests .....	328
3.5	Reset Management Functional Description .....	329
3.5.1	Overview .....	329
3.5.1.1	SCRM Reset Management Functional Description .....	329
3.5.1.1.1	Power-On Reset .....	329
3.5.1.1.2	Warm Reset .....	329
3.5.1.2	PRM Reset Management Functional Description .....	329
3.5.2	General Characteristics of Reset Signals .....	330
3.5.2.1	Scope .....	330
3.5.2.2	Occurrence .....	330
3.5.2.3	Source Type .....	330
3.5.2.4	Retention Type .....	331
3.5.3	Reset Sources .....	331
3.5.3.1	Global Reset Sources .....	331
3.5.3.2	Local Reset Sources .....	331
3.5.4	Reset Domains .....	332
3.5.5	Reset Logging .....	346
3.5.5.1	PRCM Module Reset Logging Mechanism .....	347

3.5.6	Reset Sequences .....	347
3.5.6.1	SCRM Power-on Reset Sequence .....	347
3.5.6.2	PRCM Module Power-On Reset Sequence .....	348
3.5.6.3	Cortex-A9 MPU Subsystem Power-On Reset Sequence .....	349
3.5.6.4	Cortex-A9 MPU Subsystem Warm Reset Sequence .....	350
3.5.6.5	Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or Off STATE .....	351
3.5.6.6	IVAHD Subsystem Power-On Reset Sequence .....	352
3.5.6.7	IVAHD Subsystem Software Warm Reset Sequence .....	352
3.5.6.8	DSP Subsystem Power-On Reset Sequence .....	353
3.5.6.9	DSP Subsystem Software Warm Reset Sequence .....	354
3.5.6.10	DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State .....	355
3.5.6.11	Cortex-M3 MPU Subsystem Power-On Reset Sequence .....	356
3.5.6.12	Cortex-M3 MPU Subsystem Software Warm Reset Sequence .....	357
3.5.6.13	Global Warm Reset Sequence .....	359
3.6	Clock Management Functional Description .....	361
3.6.1	Overview .....	361
3.6.2	External Clock Inputs .....	363
3.6.2.1	sys_32k Clock Input .....	363
3.6.2.2	High-Frequency System Clock Input .....	363
3.6.3	Internal Clock Sources/Generators .....	363
3.6.3.1	PRM Clock Source .....	363
3.6.3.2	CM Clock Source .....	366
3.6.3.2.1	CM1 Clock Generator .....	366
3.6.3.2.2	CM1_USB Clock Generator .....	367
3.6.3.2.3	CM1_ABE Clock Generator .....	369
3.6.3.2.4	CM2 Clock Generator .....	370
3.6.3.3	Generic DPLL Overview .....	373
3.6.3.3.1	DPLLs Output Clocks Parameters .....	374
3.6.3.3.2	Enable Control, Status, and Low-Power Operation Mode .....	375
3.6.3.3.3	DPLL Power Modes .....	376
3.6.3.3.4	DPLL Recalibration .....	377
3.6.3.3.5	DPLL Spread Spectrum Clocking .....	378
3.6.3.3.6	DPLL Output Power Down .....	378
3.6.3.4	DPLL_PER Description .....	379
3.6.3.4.1	Overview .....	379
3.6.3.4.2	Synthesized Clock Parameters .....	379
3.6.3.4.3	Power Modes .....	380
3.6.3.4.4	Recalibration .....	381
3.6.3.4.5	Spread Spectrum Clocking .....	381
3.6.3.4.6	Output Power Down .....	381
3.6.3.5	DPLL_CORE Description .....	382
3.6.3.5.1	Overview .....	382
3.6.3.5.2	Synthesized Clock Parameters .....	382
3.6.3.5.3	Power Modes .....	383
3.6.3.5.4	Recalibration .....	384
3.6.3.5.5	Spread Spectrum Clocking .....	384
3.6.3.5.6	Output Power-Down .....	385
3.6.3.6	DPLL_ABE Description .....	385
3.6.3.6.1	Overview .....	385
3.6.3.6.2	Synthesized Clock Parameters .....	385
3.6.3.6.3	Power Modes .....	386
3.6.3.6.4	Recalibration .....	386

3.6.3.6.5	Spread Spectrum Clocking .....	387
3.6.3.7	DPLL_MPU Description .....	387
3.6.3.7.1	Overview .....	387
3.6.3.7.2	Synthesized Clock Parameters .....	387
3.6.3.7.3	Power Modes .....	388
3.6.3.7.4	Recalibration .....	388
3.6.3.7.5	Spread Spectrum Clocking .....	388
3.6.3.8	DPLL_IVA Description .....	389
3.6.3.8.1	Overview .....	389
3.6.3.8.2	Synthesized Clock Parameters .....	389
3.6.3.8.3	Power Modes .....	390
3.6.3.8.4	Recalibration .....	390
3.6.3.8.5	Spread Spectrum Clocking .....	390
3.6.3.8.6	Ouput Power Down .....	390
3.6.3.9	DPLL_USB Description .....	391
3.6.3.9.1	Overview .....	391
3.6.3.9.2	Synthesized Clock Parameters .....	391
3.6.3.9.3	Power Modes .....	391
3.6.3.9.4	Spread Spectrum Clocking .....	392
3.6.3.10	DPLLs Cascading .....	392
3.6.4	CD_WKUP Clock Domain .....	394
3.6.4.1	Overview .....	394
3.6.4.2	Clock Domain Modes .....	394
3.6.4.3	Clock Domain Dependency .....	395
3.6.4.3.1	Wake-Up Dependency .....	395
3.6.4.4	Clock Domain Module Attributes .....	395
3.6.5	CD_DSP Clock Domain .....	397
3.6.5.1	Overview .....	397
3.6.5.2	Clock Domain Modes .....	397
3.6.5.3	Clock Domain Dependency .....	398
3.6.5.3.1	Static Dependency .....	398
3.6.5.3.2	Dynamic Dependency .....	398
3.6.5.4	Clock Domain Module Attributes .....	398
3.6.6	CD_STD_EFUSE Clock Domain .....	399
3.6.6.1	Overview .....	399
3.6.6.2	Clock Domain Module Attributes .....	400
3.6.7	CD_CORTEXA9 Clock Domain .....	400
3.6.7.1	Overview .....	400
3.6.7.2	Clock Domain Modes .....	400
3.6.7.3	Clock Domain Dependency .....	401
3.6.7.3.1	Static Dependency .....	401
3.6.7.3.2	Dynamic Dependency .....	401
3.6.7.4	Clock Domain Module Attributes .....	402
3.6.8	CD_L4_PER Clock Domain .....	402
3.6.8.1	Overview .....	402
3.6.8.2	Clock Domain Modes .....	403
3.6.8.3	Clock Domain Dependency .....	404
3.6.8.3.1	Dynamic Dependency .....	404
3.6.8.3.2	Wake-Up Dependency .....	404
3.6.8.4	Clock Domain Module Attributes .....	409
3.6.9	CD_L3_INIT Clock Domain .....	414
3.6.9.1	Overview .....	414
3.6.9.2	Clock Domain Modes .....	415

3.6.9.3	Clock Domain Dependency .....	416
3.6.9.3.1	Static Dependency .....	416
3.6.9.3.2	Dynamic Dependency .....	416
3.6.9.3.3	Wake-Up Dependency .....	416
3.6.9.4	Clock Domain Module Attributes .....	418
3.6.10	CD_IVAHD Clock Domain .....	421
3.6.10.1	Overview .....	421
3.6.10.2	Clock Domain Modes .....	421
3.6.10.3	Clock Domain Dependency .....	421
3.6.10.3.1	Static Dependency .....	421
3.6.10.3.2	Dynamic Dependency .....	422
3.6.10.4	Clock Domain Module Attributes .....	422
3.6.11	CD_SGX Clock Domain .....	423
3.6.11.1	Overview .....	423
3.6.11.2	Clock Domain Modes .....	423
3.6.11.3	Clock Domain Dependency .....	423
3.6.11.3.1	Static Dependency .....	423
3.6.11.3.2	Dynamic Dependency .....	424
3.6.11.4	Clock Domain Module Attributes .....	424
3.6.12	CD_EMU Clock Domain .....	425
3.6.12.1	Overview .....	425
3.6.12.2	Clock Domain Modes .....	425
3.6.12.3	Clock Domain Dependency .....	426
3.6.12.3.1	Dynamic Dependency .....	426
3.6.12.4	Clock Domain Module Attributes .....	426
3.6.13	CD_DSS Clock Domain .....	426
3.6.13.1	Overview .....	426
3.6.13.2	Clock Domain Modes .....	427
3.6.13.3	Clock Domain Dependency .....	427
3.6.13.3.1	Static Dependency .....	427
3.6.13.3.2	Dynamic Dependency .....	428
3.6.13.3.3	Wake-Up Dependency .....	428
3.6.13.4	Clock Domain Module Attributes .....	429
3.6.14	CD_L4_CFG Clock Domain .....	430
3.6.14.1	Overview .....	430
3.6.14.2	Clock Domain Modes .....	430
3.6.14.3	Clock Domain Dependency .....	431
3.6.14.3.1	Dynamic Dependency .....	431
3.6.14.4	Clock Domain Module Attributes .....	431
3.6.15	CD_L3_INSTR Clock Domain .....	432
3.6.15.1	Overview .....	432
3.6.15.2	Clock Domain Modes .....	433
3.6.15.3	Clock Domain Dependency .....	433
3.6.15.4	Clock Domain Module Attributes .....	433
3.6.16	CD_L3_2 Clock Domain .....	434
3.6.16.1	Overview .....	434
3.6.16.2	Clock Domain Modes .....	435
3.6.16.3	Clock Domain Dependency .....	435
3.6.16.3.1	Dynamic Dependency .....	435
3.6.16.4	Clock Domain Module Attributes .....	436
3.6.17	CD_L3_1 Clock Domain .....	437
3.6.17.1	Overview .....	437
3.6.17.2	Clock Domain Modes .....	437

3.6.17.3	Clock Domain Dependency .....	437
3.6.17.3.1	Dynamic Dependency .....	437
3.6.17.4	Clock Domain Module Attributes .....	438
3.6.18	CD_EMIF Clock Domain .....	438
3.6.18.1	Overview .....	438
3.6.18.2	Clock Domain Modes .....	439
3.6.18.3	Clock Domain Dependency .....	439
3.6.18.4	Clock Domain Module Attributes .....	439
3.6.19	CD_CORTEXM3 Clock Domain .....	441
3.6.19.1	Overview .....	441
3.6.19.2	Clock Domain Modes .....	441
3.6.19.3	Clock Domain Dependency .....	441
3.6.19.3.1	Static Dependency .....	441
3.6.19.3.2	Dynamic Dependency .....	442
3.6.19.4	Clock Domain Module Attributes .....	442
3.6.20	CD_DMA Clock Domain .....	443
3.6.20.1	Overview .....	443
3.6.20.2	Clock Domain Modes .....	443
3.6.20.3	Clock Domain Dependency .....	444
3.6.20.4	Clock Domain Module Attributes .....	444
3.6.21	CD_C2C Clock Domain .....	444
3.6.21.1	Overview .....	444
3.6.21.2	Clock Domain Modes .....	445
3.6.21.3	Clock Domain Dependency .....	445
3.6.21.3.1	Static Dependency .....	445
3.6.21.3.2	Dynamic Dependency .....	446
3.6.21.4	Clock Domain Module Attributes .....	446
3.6.22	CD_CAM Clock Domain .....	447
3.6.22.1	Overview .....	447
3.6.22.2	Clock Domain Modes .....	447
3.6.22.3	Clock Domain Dependency .....	448
3.6.22.3.1	Static Dependency .....	448
3.6.22.3.2	Dynamic Dependency .....	448
3.6.22.4	Clock Domain Module Attributes .....	448
3.6.23	CD_ABE Clock Domain .....	449
3.6.23.1	Overview .....	449
3.6.23.2	Clock Domain Modes .....	449
3.6.23.3	Clock Domain Dependency .....	450
3.6.23.3.1	Wake-Up Dependency .....	450
3.6.23.4	Clock Domain Module Attributes .....	452
3.6.24	CD_L4_ALWON_CORE Clock Domain .....	455
3.6.24.1	Overview .....	455
3.6.24.2	Clock Domain Modes .....	456
3.6.24.3	Clock Domain Dependency .....	456
3.6.24.3.1	Wake-Up Dependency .....	456
3.6.24.4	Clock Domain Module Attributes .....	456
3.7	Power Management Functional Description .....	457
3.7.1	PD_WKUP Description .....	457
3.7.1.1	Power Domain Modes .....	458
3.7.2	PD_DSP Description .....	458
3.7.2.1	Power Domain Modes .....	458
3.7.2.1.1	Logic and Memory Area Power Modes .....	458
3.7.2.1.2	Logic and Memory Area Power Modes Control and Status .....	459

3.7.3	PD_STD_EFUSE Description .....	459
3.7.3.1	Power Domain Modes .....	460
3.7.4	PD_MPU Description .....	460
3.7.4.1	Power Domain Modes .....	460
3.7.4.1.1	Logic and Memory Area Power Modes .....	460
3.7.4.1.2	Logic and Memory Area Power Modes Control and Status .....	461
3.7.5	PD_L4_PER Description .....	461
3.7.5.1	Power Domain Modes .....	463
3.7.5.1.1	Logic and Memory Area Power Modes .....	463
3.7.5.1.2	Logic and Memory Area Power Modes Control and Status .....	463
3.7.6	PD_L3_INIT Description .....	464
3.7.6.1	Power Domain Modes .....	465
3.7.6.1.1	Logic and Memory Area Power Modes .....	465
3.7.6.1.2	Logic and Memory Area Power Modes Control and Status .....	465
3.7.7	PD_IVAHD Description .....	466
3.7.7.1	Power Domain Modes .....	466
3.7.7.1.1	Logic and Memory Area Power Modes .....	466
3.7.7.1.2	Logic and Memory Area Power Modes Control and Status .....	467
3.7.8	PD_SGX Description .....	468
3.7.8.1	Power Domain Modes .....	468
3.7.8.1.1	Logic and Memory Area Power Modes .....	468
3.7.8.1.2	Logic and Memory Area Power Modes Control and Status .....	468
3.7.9	PD_EMU Description .....	469
3.7.9.1	Power Domain Modes .....	469
3.7.9.1.1	Logic and Memory Area Power Modes .....	469
3.7.9.1.2	Logic and Memory Area Power Modes Control and Status .....	470
3.7.10	PD_DSS Description .....	470
3.7.10.1	Power Domain Modes .....	470
3.7.10.1.1	Logic and Memory Area Power Modes .....	470
3.7.10.1.2	Logic and Memory Area Power Modes Control and Status .....	471
3.7.11	PD_CORE Description .....	471
3.7.11.1	Power Domain Modes .....	473
3.7.11.1.1	Logic and Memory Area Power Modes .....	473
3.7.11.1.2	Logic and Memory Area Power Modes Control and Status .....	473
3.7.12	PD_CAM Description .....	475
3.7.12.1	Power Domain Modes .....	475
3.7.12.1.1	Logic and Memory Area Power Modes .....	475
3.7.12.1.2	Logic and Memory Area Power Modes Control and Status .....	475
3.7.13	PD_AUDIO Description .....	476
3.7.13.1	Power Domain Modes .....	477
3.7.13.1.1	Logic and Memory Area Power Modes .....	477
3.7.13.1.2	Logic and Memory Area Power Modes Control and Status .....	477
3.7.14	PD_ALWON_MPU Description .....	478
3.7.14.1	Power Domain Modes .....	478
3.7.15	PD_ALWON_DSP Description .....	478
3.7.15.1	Power Domain Modes .....	478
3.7.16	PD_ALWON_CORE Description .....	479
3.7.16.1	Power Domain Modes .....	479
3.8	Voltage Management Functional Description .....	480
3.8.1	Overview .....	480
3.8.2	Voltage-Control Architecture .....	480
3.8.3	VDD_MPU_L, VDD_CORE_L, and VDD_IVA_L Control .....	481
3.8.3.1	PRM Dedicated I <sup>2</sup> C Control .....	481

3.8.3.2	Adaptive Voltage Scaling .....	482
3.8.3.2.1	SmartReflex in the Device .....	482
3.8.3.2.2	SmartReflex Module .....	483
3.8.3.2.3	SmartReflex Submodules .....	484
3.8.3.2.4	Status Register .....	487
3.8.3.2.5	SmartReflex Parameters Set After Silicon Characterization .....	487
3.8.3.2.6	Voltage Processor Module .....	487
3.8.3.2.7	SMPS-Dependent Parameter Configuration .....	490
3.8.3.2.8	Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS .....	490
3.8.4	Internal LDOs Control .....	491
3.8.4.1	Memory LDOs .....	491
3.8.4.2	LDO_WAKEUP .....	491
3.8.4.3	ABB LDOs Control .....	492
3.8.4.4	Bandgap control .....	492
3.8.5	Voltage Domain State Transitions .....	492
3.8.5.1	VDD_x_L Transitions .....	493
3.8.5.2	Memory LDOs Transitions .....	493
3.8.5.3	LDO_WAKEUP Transitions .....	494
3.8.6	DVFS .....	494
3.8.6.1	EMIF Clocks Frequency Scaling Constraints .....	494
3.8.6.2	GPMC Clocks Frequency Scaling Constraints .....	496
3.8.6.3	CORE DVFS Versus Subsystem Functionality .....	497
3.8.6.3.1	Display Subsystem .....	497

8-1233. Clocks and Resets .....	1877
8-1234. Hardware Requests.....	1877
8-1235. ISS SIMCOP Clock Control Register Settings .....	1878
8-1236. Autoclock Gating Bit Control.....	1878
8-1237. SIMCOP Interrupts.....	1880
8-1238. Global Initialization of Surrounding Modules .....	1881
8-1239. ISS SIMCOP Global Initialization .....	1881
8-1240. JPEG Encode Pipeline .....	1883
8-1241. SIMCOP Instance Summary.....	1884
8-1242. SIMCOP_CONTROL Register Mapping Summary .....	1884
8-1243. SIMCOP_HL_REVISION.....	1884
8-1244. Register Call Summary for Register SIMCOP_HL_REVISION .....	1885
8-1245. SIMCOP_HL_HWINFO.....	1885
8-1246. Register Call Summary for Register SIMCOP_HL_HWINFO .....	1886
8-1247. SIMCOP_HL_SYSCONFIG.....	1886
8-1248. Register Call Summary for Register SIMCOP_HL_SYSCONFIG .....	1887
8-1249. SIMCOP_HL_IRQSTATUS_RAW_i .....	1887
8-1250. Register Call Summary for Register SIMCOP_HL_IRQSTATUS_RAW_i.....	1889
8-1251. SIMCOP_HL_IRQSTATUS_i .....	1890
8-1252. Register Call Summary for Register SIMCOP_HL_IRQSTATUS_i .....	1892
8-1253. SIMCOP_HL_IRQENABLE_SET_i .....	1893
8-1254. Register Call Summary for Register SIMCOP_HL_IRQENABLE_SET_i.....	1895
8-1255. SIMCOP_HL_IRQENABLE_CLR_i .....	1896
8-1256. Register Call Summary for Register SIMCOP_HL_IRQENABLE_CLR_i.....	1898
8-1257. SIMCOP_CTRL .....	1899
8-1258. Register Call Summary for Register SIMCOP_CTRL .....	1900
8-1259. SIMCOP_CLKCTRL .....	1901
8-1260. Register Call Summary for Register SIMCOP_CLKCTRL.....	1902
8-1261. SIMCOP Memory Mapping .....	1903
8-1262. Integration Attributes.....	1905
8-1263. Clocks and Resets .....	1905
8-1264. Hardware Requests.....	1906
8-1265. Static Crossbar Control Summary .....	1908
8-1266. Static Crossbar Control Summary (2/2).....	1908
8-1267. Image Buffer Address Map .....	1909
8-1268. Coefficient Buffer Organization.....	1911
8-1269. Quantization Table Storage in QUANT Memory .....	1911
8-1270. QUANT Memory Organization .....	1912
8-1271. HUFF Memory Organization.....	1912
8-1272. Bitstream Buffer Mapping to SIMCOP DMA.....	1912
8-1273. LDC_LUT Memory Organization .....	1913
8-1274. LUT Memory Format on 32-Bit Words .....	1913
8-1275. Rotation Macroblock Pipeline.....	1920
8-1276. LDC Transformation .....	1921
8-1277. Concurrent Software and Hardware Sequencing.....	1922
8-1278. Hardware Sequencer Instance Summary.....	1923
8-1279. HWSEQ Registers Mapping Summary.....	1923
8-1280. SIMCOP_HWSEQ_CTRL.....	1924
8-1281. Register Call Summary for Register SIMCOP_HWSEQ_CTRL .....	1925

8-1282. SIMCOP_HWSEQ_STATUS .....	1926
8-1283. Register Call Summary for Register SIMCOP_HWSEQ_STATUS.....	1926
8-1284. SIMCOP_HWSEQ_OVERRIDE .....	1926
8-1285. Register Call Summary for Register SIMCOP_HWSEQ_OVERRIDE .....	1927
8-1286. SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE.....	1927
8-1287. Register Call Summary for Register SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE .....	1930
8-1288. SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE .....	1930
8-1289. Register Call Summary for Register SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE .....	1932
8-1290. SIMCOP_HWSEQ_STEP_CTRL2_OVERRIDE .....	1932
8-1291. Register Call Summary for Register SIMCOP_HWSEQ_STEP_CTRL2_OVERRIDE.....	1933
8-1292. SIMCOP_HWSEQ_STEP_CTRL_i .....	1934
8-1293. Register Call Summary for Register SIMCOP_HWSEQ_STEP_CTRL_i.....	1936
8-1294. SIMCOP_HWSEQ_STEP_SWITCH_i .....	1936
8-1295. Register Call Summary for Register SIMCOP_HWSEQ_STEP_SWITCH_i.....	1938
8-1296. SIMCOP_HWSEQ_STEP_IMX_CTRL_i.....	1938
8-1297. Register Call Summary for Register SIMCOP_HWSEQ_STEP_IMX_CTRL_i .....	1939
8-1298. SIMCOP_HWSEQ_STEP_CTRL2_i.....	1939
8-1299. Register Call Summary for Register SIMCOP_HWSEQ_STEP_CTRL2_i .....	1940
8-1300. Integration Attributes.....	1942
8-1301. Clocks and Resets .....	1942
8-1302. Hardware Requests.....	1943
8-1303. Local Power-Management Features.....	1944
8-1304. SIMCOP DMA Events List .....	1945
8-1305. Allowed Maximum Burst Size .....	1949
8-1306. Initialization of Surrounding Modules .....	1949
8-1307. SIMCOP DMA Instance Summary .....	1953
8-1308. DMA Register Mapping Summary .....	1953
8-1309. SIMCOP_DMA_REVISION .....	1954
8-1310. Register Call Summary for Register SIMCOP_DMA_REVISION.....	1954
8-1311. SIMCOP_DMA_HWINFO .....	1954
8-1312. Register Call Summary for Register SIMCOP_DMA_HWINFO.....	1954
8-1313. SIMCOP_DMA_SYSCONFIG .....	1955
8-1314. Register Call Summary for Register SIMCOP_DMA_SYSCONFIG.....	1955
8-1315. SIMCOP_DMA_CTRL .....	1955
8-1316. Register Call Summary for Register SIMCOP_DMA_CTRL .....	1956
8-1317. SIMCOP_DMA_IRQSTATUS_RAW_j.....	1956
8-1318. Register Call Summary for Register SIMCOP_DMA_IRQSTATUS_RAW_j .....	1958
8-1319. SIMCOP_DMA_IRQSTATUS_j .....	1959
8-1320. Register Call Summary for Register SIMCOP_DMA_IRQSTATUS_j.....	1961
8-1321. SIMCOP_DMA_IRQENABLE_SET_j.....	1961
8-1322. Register Call Summary for Register SIMCOP_DMA_IRQENABLE_SET_j .....	1963
8-1323. SIMCOP_DMA_IRQENABLE_CLR_j.....	1963
8-1324. Register Call Summary for Register SIMCOP_DMA_IRQENABLE_CLR_j .....	1966
8-1325. SIMCOP_DMA_CHAN_CTRL_i.....	1966
8-1326. Register Call Summary for Register SIMCOP_DMA_CHAN_CTRL_i .....	1968
8-1327. SIMCOP_DMA_CHAN_SMEM_ADDR_i .....	1968
8-1328. Register Call Summary for Register SIMCOP_DMA_CHAN_SMEM_ADDR_i.....	1968
8-1329. SIMCOP_DMA_CHAN_SMEM_OFST_i.....	1968
8-1330. Register Call Summary for Register SIMCOP_DMA_CHAN_SMEM_OFST_i .....	1968

8-1331. SIMCOP_DMA_CHAN_BUF_OFST_i.....	1969
8-1332. Register Call Summary for Register SIMCOP_DMA_CHAN_BUF_OFST_i.....	1969
8-1333. SIMCOP_DMA_CHAN_BUF_ADDR_i.....	1969
8-1334. Register Call Summary for Register SIMCOP_DMA_CHAN_BUF_ADDR_i.....	1969
8-1335. SIMCOP_DMA_CHAN_BLOCK_SIZE_i.....	1970
8-1336. Register Call Summary for Register SIMCOP_DMA_CHAN_BLOCK_SIZE_i.....	1970
8-1337. SIMCOP_DMA_CHAN_FRAME_i.....	1970
8-1338. Register Call Summary for Register SIMCOP_DMA_CHAN_FRAME_i.....	1970
8-1339. SIMCOP_DMA_CHAN_CURRENT_BLOCK_i.....	1971
8-1340. Register Call Summary for Register SIMCOP_DMA_CHAN_CURRENT_BLOCK_i.....	1971
8-1341. SIMCOP_DMA_CHAN_BLOCK_STEP_i.....	1971
8-1342. Register Call Summary for Register SIMCOP_DMA_CHAN_BLOCK_STEP_i.....	1971
8-1343. Integration Attributes.....	1975
8-1344. Clocks and Resets.....	1976
8-1345. Hardware Requests.....	1976
8-1346. Local Power-Management Features.....	1977
8-1347. Events.....	1978
8-1348. Initialization of Surrounding Modules.....	1982
8-1349. DCT Processing Procedure.....	1982
8-1350. IDCT Processing Procedure.....	1982
8-1351. ISS SIMCOP DCT Instance Summary.....	1984
8-1352. DCT Register Mapping Summary.....	1984
8-1353. DCT_VERSION.....	1985
8-1354. Register Call Summary for Register DCT_VERSION.....	1985
8-1355. DCT_CTRL.....	1985
8-1356. Register Call Summary for Register DCT_CTRL.....	1985
8-1357. DCT_CFG.....	1986
8-1358. Register Call Summary for Register DCT_CFG.....	1986
8-1359. DCT_SPTR.....	1987
8-1360. Register Call Summary for Register DCT_SPTR.....	1987
8-1361. DCT_FPTR.....	1987
8-1362. Register Call Summary for Register DCT_FPTR.....	1987
8-1363. Integration Attributes.....	1990
8-1364. Clocks and Resets.....	1990
8-1365. Hardware Requests.....	1991
8-1366. Local Power-Management Feature.....	1992
8-1367. Events.....	1992
8-1368. Image Buffer Block Format.....	1994
8-1369. Recommended QMEM Allocation for YUV4:2:0 and YUV4:2:2.....	1995
8-1370. Initialization of Surrounding Modules.....	1999
8-1371. JPEG Encoding Procedure.....	1999
8-1372. JPEG Decoding Procedure.....	2000
8-1373. Concurrent JPEG Encoding and Decoding.....	2002
8-1374. Sample Luma DC Huffman Code Table.....	2005
8-1375. ISS SIMCOP VLCDJ Instance Summary.....	2007
8-1376. VLCDJ Register Mapping Summary.....	2007
8-1377. VLCDJ_REVISION.....	2008
8-1378. Register Call Summary for Register VLCDJ_REVISION.....	2008
8-1379. VLCDJ_CTRL.....	2008

8-1380. Register Call Summary for Register VLCDJ_CTRL .....	2009
8-1381. VLCDJE_CFG .....	2009
8-1382. Register Call Summary for Register VLCDJE_CFG.....	2010
8-1383. VLCDJE_DCPREDY.....	2010
8-1384. Register Call Summary for Register VLCDJE_DCPREDY .....	2010
8-1385. VLCDJE_DCPREDUV.....	2010
8-1386. Register Call Summary for Register VLCDJE_DCPREDUV .....	2010
8-1387. VLCDJE_BSPTR.....	2011
8-1388. Register Call Summary for Register VLCDJE_BSPTR .....	2011
8-1389. VLCDJE_CBUF .....	2011

23-157. UART Mode Register Overview .....	4192
23-158. IrDA Mode Register Overview .....	4193
23-159. CIR Mode Register Overview .....	4194
23-160. UART Baud Rate Settings (48-MHz Clock) .....	4196
23-161. UART Parity Bit Encoding.....	4197
23-162. UART_EFR[0:3] Software Flow Control Options.....	4198
23-163. IrDA Baud Rate Settings .....	4202
23-164. Duty Cycle .....	4207
23-165. UART/IrDA/CIR Instance Summary .....	4216
23-166. UART/IrDA/CIR Register Mapping Summary (UART1 and UART2).....	4216
23-167. UART/IrDA/CIR Register Mapping Summary (UART3 and UART4).....	4217
23-168. UART_THR .....	4218
23-169. Register Call Summary for Register UART_THR.....	4219
23-170. UART_RHR.....	4219

23-171. Register Call Summary for Register UART_RHR .....	4219
23-172. UART_DLL.....	4220
23-173. Register Call Summary for Register UART_DLL .....	4220
23-174. UART_IER .....	4220
23-175. Register Call Summary for Register UART_IER.....	4221
23-176. UART_IIR .....	4223
23-177. Register Call Summary for Register UART_IIR.....	4223
23-178. UART_DLH .....	4225
23-179. Register Call Summary for Register UART_DLH.....	4225
23-180. UART_FCR .....	4226
23-181. Register Call Summary for Register UART_FCR.....	4227
23-182. UART_EFR .....	4227
23-183. Register Call Summary for Register UART_EFR.....	4228
23-184. UART_LCR .....	4228
23-185. Register Call Summary for Register UART_LCR.....	4230
23-186. UART_XON1_ADDR1.....	4230
23-187. Register Call Summary for Register UART_XON1_ADDR1 .....	4230
23-188. UART_MCR.....	4231
23-189. Register Call Summary for Register UART_MCR .....	4232
23-190. UART_LSR .....	4232
23-191. Register Call Summary for Register UART_LSR .....	4233
23-192. UART_XON2_ADDR2.....	4235
23-193. Register Call Summary for Register UART_XON2_ADDR2 .....	4235
23-194. UART_TCR .....	4235
23-195. Register Call Summary for Register UART_TCR.....	4236
23-196. UART_XOFF1 .....	4236
23-197. Register Call Summary for Register UART_XOFF1.....	4236
23-198. UART_MSR.....	4237
23-199. Register Call Summary for Register UART_MSR .....	4237
23-200. UART_SPR .....	4238
23-201. Register Call Summary for Register UART_SPR.....	4238
23-202. UART_TLR.....	4238
23-203. Register Call Summary for Register UART_TLR .....	4239
23-204. UART_XOFF2 .....	4239
23-205. Register Call Summary for Register UART_XOFF2.....	4239
23-206. UART_MDR1 .....	4239
23-207. Register Call Summary for Register UART_MDR1.....	4241
23-208. UART_MDR2 .....	4241
23-209. Register Call Summary for Register UART_MDR2.....	4242
23-210. UART_SFLSR .....	4243
23-211. Register Call Summary for Register UART_SFLSR.....	4243
23-212. UART_TXFLL.....	4244
23-213. Register Call Summary for Register UART_TXFLL .....	4244
23-214. UART_RESUME .....	4244
23-215. Register Call Summary for Register UART_RESUME.....	4245
23-216. UART_TXFLH .....	4245
23-217. Register Call Summary for Register UART_TXFLH.....	4245
23-218. UART_SFREGL .....	4246
23-219. Register Call Summary for Register UART_SFREGL .....	4246

23-220. UART_RXFLL .....	4246
23-221. Register Call Summary for Register UART_RXFLL .....	4247
23-222. UART_SFREGH .....	4247
23-223. Register Call Summary for Register UART_SFREGH .....	4247
23-224. UART_RXFLH .....	4248
23-225. Register Call Summary for Register UART_RXFLH .....	4248
23-226. UART_BLR .....	4248
23-227. Register Call Summary for Register UART_BLR .....	4249
23-228. UART_UASR .....	4249
23-229. Register Call Summary for Register UART_UASR .....	4250
23-230. UART_ACREG .....	4250
23-231. Register Call Summary for Register UART_ACREG .....	4251
23-232. UART_SCR .....	4251
23-233. Register Call Summary for Register UART_SCR .....	4252
23-234. UART_SSR .....	4253
23-235. Register Call Summary for Register UART_SSR .....	4253
23-236. UART_EBLR .....	4254
23-237. Register Call Summary for Register UART_EBLR .....	4254
23-238. UART_MVR .....	4255
23-239. Register Call Summary for Register UART_MVR .....	4255
23-240. UART_SYSC .....	4255
23-241. Register Call Summary for Register UART_SYSC .....	4256
23-242. UART_SYSS .....	4256
23-243. Register Call Summary for Register UART_SYSS .....	4257
23-244. UART_WER .....	4257
23-245. Register Call Summary for Register UART_WER .....	4258
23-246. UART_CFPS .....	4258
23-247. Register Call Summary for Register UART_CFPS .....	4259
23-248. UART_RXFIFO_LVL .....	4259
23-249. Register Call Summary for Register UART_RXFIFO_LVL .....	4259
23-250. UART_TXFIFO_LVL .....	4259
23-251. Register Call Summary for Register UART_TXFIFO_LVL .....	4259
23-252. UART_IER2 .....	4260
23-253. Register Call Summary for Register UART_IER2 .....	4260
23-254. UART_ISR2 .....	4260
23-255. Register Call Summary for Register UART_ISR2 .....	4261
23-256. UART_FREQ_SEL .....	4261
23-257. Register Call Summary for Register UART_FREQ_SEL .....	4261
23-258. UART_MDR3 .....	4262
23-259. Register Call Summary for Register UART_MDR3 .....	4262
23-260. UART_TX_DMA_THRESHOLD .....	4262
23-261. Register Call Summary for Register UART_TX_DMA_THRESHOLD .....	4263
23-262. MCSPI I/O Description (Master Mode) .....	4268
23-263. MCSPI I/O Description (Slave Mode) .....	4268
23-264. SPI Master Clock Rates .....	4269
23-265. Phase and Polarity Combinations .....	4270
23-266. Integration Attributes .....	4275
23-267. Clocks and Resets .....	4275
23-268. Hardware Requests .....	4275

23-269. Wake-Up Requests .....	4276
23-270. SPI Master Clock Rates.....	4283
23-271. CLKSPPIO High/Low Time Computation .....	4283
23-272. Clock Granularity Examples .....	4284
23-273. FIFO Writes, Word Length Relationship .....	4289
23-274. Smart-Idle Mode and Wake-Up Capabilities .....	4296
23-275. Global Initialization of Surrounding Modules .....	4298
23-276. MCSPI Global Initialization.....	4298
23-277. MCSPI Receive Mode initialization .....	4298
23-278. MCSPI Transmit Mode initialization .....	4299
23-279. MCSPI Transmit and Receive Mode initialization.....	4299
23-280. Receive-Only Procedure – Polling Method .....	4299
23-281. Receive-Only Procedure – Interrupt Method .....	4299
23-282. Transmit-Only Procedure – Polling Method .....	4300
23-283. Transmit and Receive Procedure – Polling Method .....	4300
23-284. Receive-Only Procedure With Word Count – Polling Method.....	4300
23-285. Transmit-Only Procedure Without Word Count – Polling Method .....	4301
23-286. Transmit-Only Procedure With Word Count – Interrupt Method .....	4301
23-287. Transmit and Receive Procedure With Word Count – Polling Method .....	4301
23-288. Transmit and Receive Procedure With Word Count – Interrupt Method.....	4301
23-289. Transmit and Receive Procedure Without Word Count – Polling Method.....	4302
23-290. MCSPI Instance Summary.....	4303
23-291. MCSPI Register Summary .....	4303
23-292. MCSPI_HL_REV .....	4304
23-293. Register Call Summary for Register MCSPI_HL_REV.....	4304
23-294. MCSPI_HL_HWINFO.....	4304
23-295. Register Call Summary for Register MCSPI_HL_HWINFO .....	4305
23-296. MCSPI_HL_SYSCONFIG.....	4305
23-297. Register Call Summary for Register MCSPI_HL_SYSCONFIG .....	4306
23-298. MCSPI_REVISION.....	4306
23-299. Register Call Summary for Register MCSPI_REVISION .....	4306
23-300. MCSPI_SYSCONFIG.....	4307
23-301. Register Call Summary for Register MCSPI_SYSCONFIG .....	4308
23-302. MCSPI_SYSSTATUS .....	4308
23-303. Register Call Summary for Register MCSPI_SYSSTATUS .....	4308
23-304. MCSPI_IRQSTATUS .....	4308
23-305. Register Call Summary for Register MCSPI_IRQSTATUS.....	4311
23-306. MCSPI_IRQENABLE .....	4311
23-307. Register Call Summary for Register MCSPI_IRQENABLE.....	4313
23-308. MCSPI_WAKEUPENABLE .....	4313
23-309. Register Call Summary for Register MCSPI_WAKEUPENABLE .....	4314
23-310. MCSPI_SYST .....	4314
23-311. Register Call Summary for Register MCSPI_SYST .....	4315
23-312. MCSPI_MODULCTRL.....	4315
23-313. Register Call Summary for Register MCSPI_MODULCTRL .....	4317
23-314. MCSPI_CHxCONF.....	4317
23-315. Register Call Summary for Register MCSPI_CHxCONF .....	4321
23-316. MCSPI_CHxSTAT .....	4321
23-317. Register Call Summary for Register MCSPI_CHxSTAT .....	4322

23-318. MCSPI_CHxCTRL .....	4323
23-319. Register Call Summary for Register MCSPI_CHxCTRL.....	4323
23-320. MCSPI_TXx.....	4324
23-321. Register Call Summary for Register MCSPI_TXx .....	4324
23-322. MCSPI_RXx .....	4324
23-323. Register Call Summary for Register MCSPI_RXx .....	4325
23-324. MCSPI_XFERLEVEL .....	4325
23-325. Register Call Summary for Register MCSPI_XFERLEVEL .....	4326
23-326. Functions Description.....	4329
23-327. Input/Output Description .....	4330
23-328. Integration Attributes.....	4344
23-329. Clocks and Resets .....	4344
23-330. Hardware Requests.....	4344
23-331. Software Reset Signals to All McBSP Modules.....	4350
23-332. State of Clocks When the Module is in Idle State .....	4351
23-333. McBSP Smart Idle Mode Configuration Behavior.....	4354
23-334. Receiver Clock Mode .....	4357
23-335. Phases, Words and Bits per Frame Control Bit.....	4361
23-336. Assumptions for the Single-Phase Frame Example .....	4361
23-337. Assumptions for the Dual-Phase Frame Example .....	4362
23-338. Effects of DLB and ALB Bits on Clock Modes .....	4369
23-339. McBSP Channels .....	4377
23-340. Eight Partitions – Receive Channel Assignment and Control .....	4378
23-341. Eight Partitions – Transmit Channel Assignment and Control .....	4379
23-342. Selecting a Transmit Multi-Channel Selection Mode with the XMCM Bit Field .....	4380
23-343. McBSP Channel Control Options .....	4381
23-344. Register Call Summary for Flow Diagram of McBSP Initialization Procedure .....	4387
23-345. Register Call Summary for Flow Diagram for the SRG Registers Programmation.....	4388
23-346. Data Transfer DMA Request Configuration.....	4389
23-347. Interruption Configuration .....	4389
23-348. Receiver Reset .....	4389
23-349. Global Configuration .....	4390
23-350. Data Configuration .....	4390
23-351. Frame Sync Configuration .....	4390
23-352. Clock Configuration .....	4391
23-353. Take the Receiver Out of Reset .....	4391
23-354. Transmitter Reset .....	4391
23-355. Global Configuration .....	4392
23-356. Data Configuration .....	4392
23-357. Frame-Synchronization Configuration .....	4392
23-358. Clock Configuration .....	4393
23-359. Take the Receiver Out of Reset .....	4393
23-360. Use Serial Receive Pins as GPIO Pins .....	4393
23-361. Use Serial Transmit Pins as GPIO Pins .....	4393
23-362. Use External Clock Pin as GPIO Pin.....	4393
23-363. McBSP Instance Summary.....	4394
23-364. McBSP1 Register Summary .....	4394
23-365. McBSP2 Register Summary .....	4395

## About This Manual

### FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

### Information About Cautions and Warnings

This book may contain cautions and warnings.

#### **CAUTION**

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

#### **WARNING**

**This is an example of a warning statement.**

**A warning statement describes a situation that could potentially cause harm to you.**

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

## Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: *<Module name>.<Register name>*; for example: UART.UASR
- For a bit field call:
  - *<Module name>.<Register name>[End:Start] <Field name> field*; for example, UART.UASR[4:0] SPEED bit field
  - *<Field name> field <Module name>.<Register name>[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - *<Module name>.<Register name>[pos] <Bit name> bit*, for example, UART.UASR[5] BIT\_BY\_CHAR bit
  - *<Bit name> bit <Module name>.<Register name>[pos]*; for example, BIT\_BY\_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see [Acrobat Reader Tips](#).

## Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatile Uint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

## Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
 <small>The height of the text box and its associated line increases or decreases as you add text. To change the width of the comment, drag the side handle.</small>	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

## Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lists words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

### To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

### To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

### Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.

- Right-click the toolbar area, and then choose *Navigation*.
- Click the Go To Previous View button or the Go To Next View button.

---

**NOTE:** This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

## History

The following table summarizes the OMAP4430 Public TRM versions.

Version	Literature Number	Date	Notes
I	SWPU231	July 2010	See <sup>(1)</sup>
J	SWPU231	August 2010	See <sup>(2)</sup>
K	SWPU231	September 2010	See <sup>(3)</sup>

<sup>(1)</sup> *OMAP4430 Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, public version I (SWPU231I) - Not released to the public domain.

<sup>(2)</sup> *OMAP4430 Multimedia Device Silicon Revision 2.0 Technical Reference Manual*, public version J (SWPU231J). - Initial release to the public domain.

<sup>(3)</sup> *OMAP4430 Multimedia Device Silicon Revision 2.x Technical Reference Manual*, public version K (SWPU231K) - Chapters impacted by changes between version J and version K:

- Chapter 1: Introduction
- Chapter 3: Power, Reset, and Clock Management
- Chapter 4: Dual Cortex-A9 MPU Subsystem
- Chapter 6: IVA-HD Subsystem
- Chapter 10: Display Subsystem
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interfaces
- Chapter 26: Keyboard Controller
- Chapter 27: Initialization
- Chapter 28: On-Chip Debug Support

## Introduction

---

---

---

This chapter introduces the features, subsystems, and architecture of the OMAP4430 high-performance multimedia device.

Topic	Page
1.1 Overview .....	256
1.2 Environment .....	257
1.3 Description .....	258
1.4 Package-On-Package Concept .....	268
1.5 Device Identification .....	269

## 1.1 Overview

The OMAP4430 high-performance multimedia application device is based on enhanced OMAP™ architecture and uses 45-nm technology.

- The architecture is designed to provide best-in-class video, image, and graphics processing for 2.5/3G wireless terminals, high-performance personal digital assistants (PDAs). For that purpose, the device supports the following functions:
  - Streaming video up to full high definition (HD) (1920 × 1080 p, 30 fps)
  - 2-dimensional (2D)/3-dimensional (3D) mobile gaming
  - Video conferencing
  - High-resolution still image (up to 16 Mp)
- The device supports high-level operating systems (OSs) such as:
  - Windows™ CE, WinMobile™
  - Symbian OS™
  - Linux®
  - Palm OS™
- The device is composed of the following subsystems:
  - Cortex™-A9 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A9 cores
  - Digital signal processor (DSP) subsystem
  - Image and video accelerator high-definition (IVA-HD) subsystem
  - Cortex™-M3 MPU subsystem, including two ARM Cortex-M3 microprocessors
  - Display subsystem
  - Audio back-end (ABE) subsystem
  - Imaging subsystem (ISS), consisting of image signal processor (ISP) and still image coprocessor (SIMCOP) block
  - 2D/3D graphic accelerator (SGX) subsystem
  - Emulation (EMU) subsystem
- The device includes state-of-art power-management techniques required for high-performance mobile products.
- Comprehensive power management is integrated into the device.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System and connecting peripherals

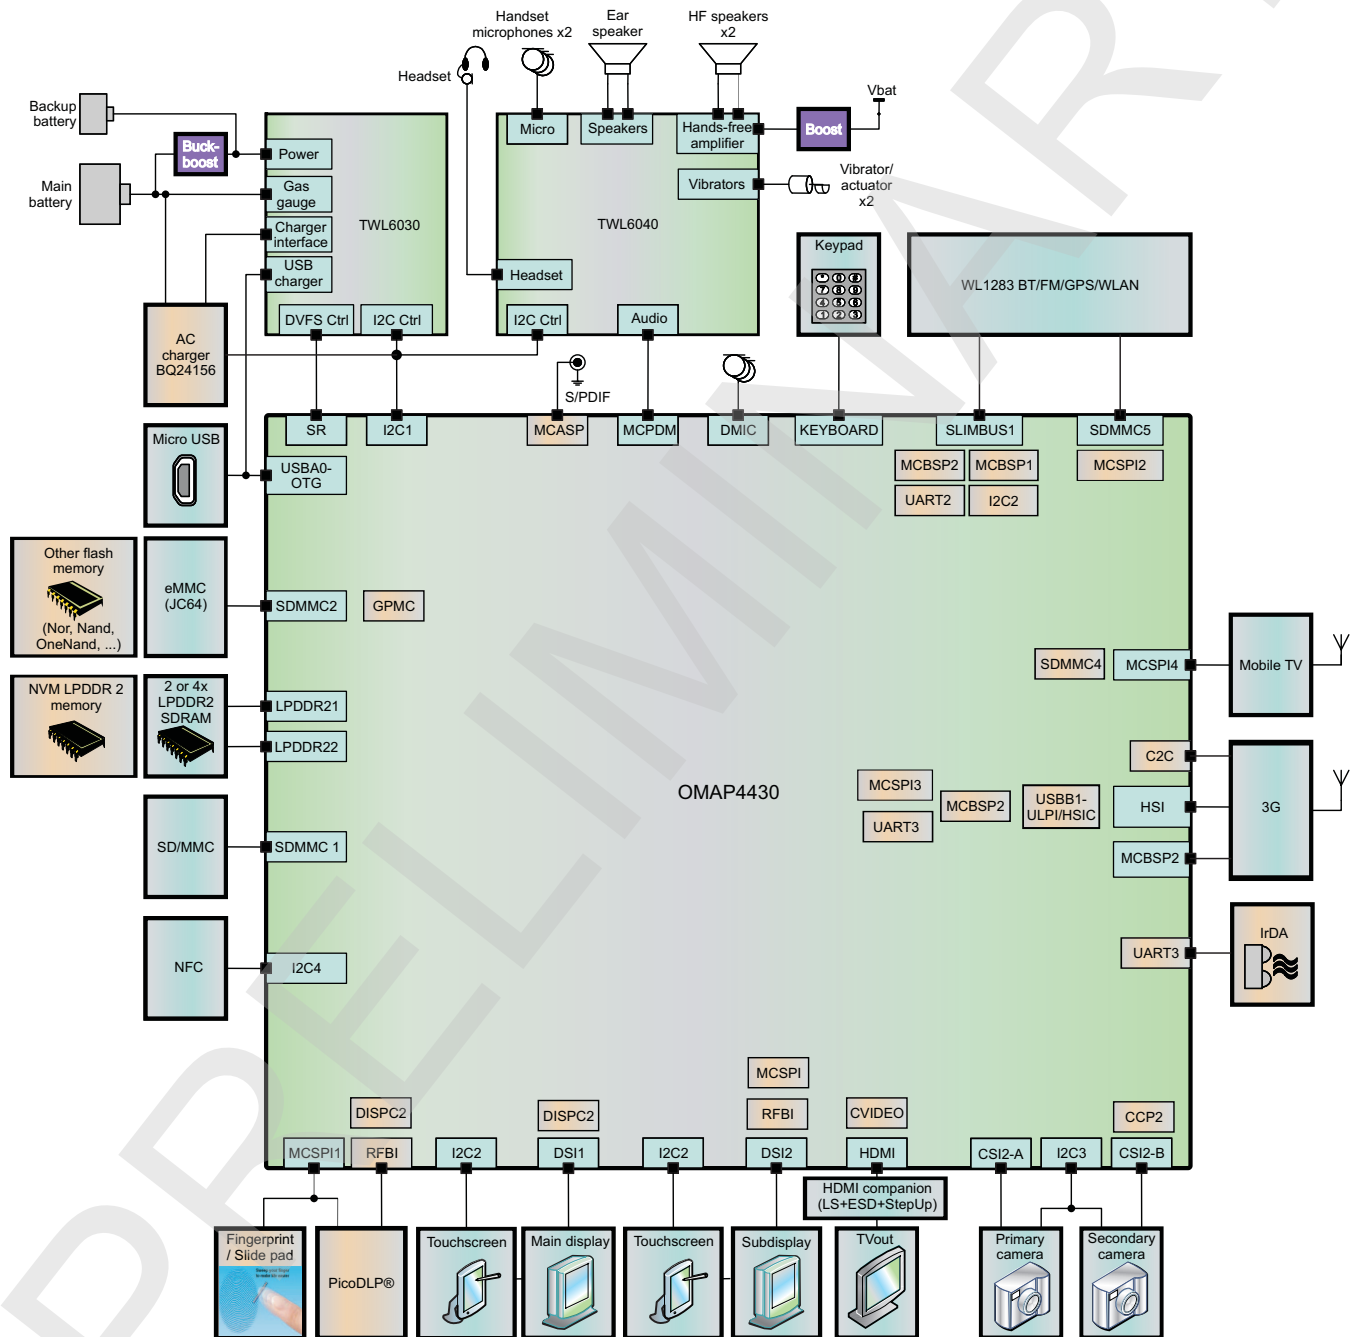

## 1.2 Environment

This section provides an overview of the OMAP environment. The device is associated with power and audio integrated circuits (ICs). TI provides a global solution with the TWL6030/TWL6040 devices.

Figure 1-1 is an overview of a nonexhaustive environment for the high-tier OMAP4430 device.

Figure 1-1. OMAP4430 High-Tier Environment

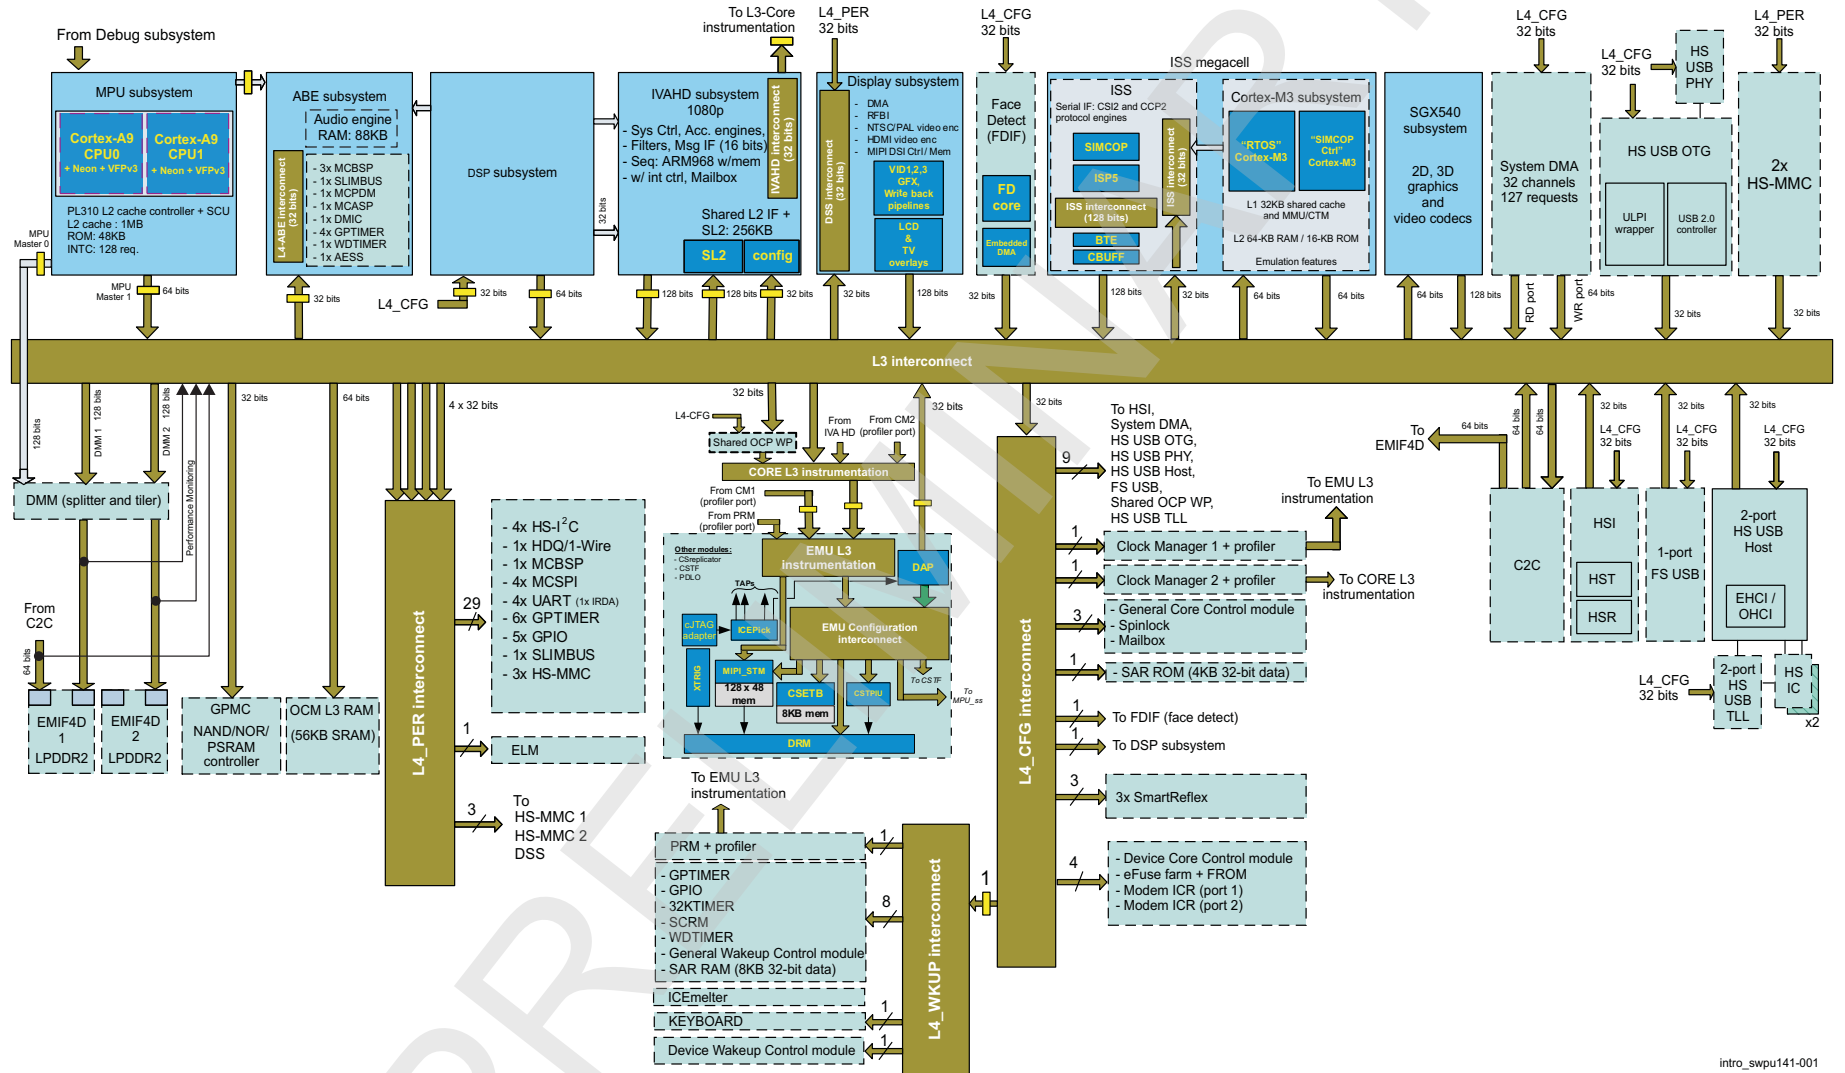

intro-002

### 1.3 Description

The device is offered in a 547-ball, 12 × 12 × 0.73-mm, 0.4-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking.

[Figure 1-2](#) is the block diagram of the OMAP4430 device.

Figure 1-2. OMAP4430 Block Diagram

intro\_swpu141-001

### 1.3.1 Cortex-A9 MPU Subsystem Description

The Cortex-A9 MPU subsystem integrates the following submodules:

- ARM Cortex-A9 MPCore
  - Two ARM Cortex-A9 central processing units (CPUs)
  - ARM Version 7 ISA™: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT and Jazelle DBX Java™ accelerators
  - Neon™ SIMD coprocessor and VFPv3 per CPU
  - Interrupt controller (Cortex-A9 MPU INTC) with up to 128 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KB instruction and 32-KB data level 1 (L1) caches per CPU
- Shared 1-MB level 2 (L2) cache
- 48 KB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

### 1.3.2 IVA-HD Subsystem Description

The IVA-HD subsystem is a set of video encoder/decoder hardware accelerators. It supports up to 1080p x 30 fps, slow-motion camcorder, triple play (HD and SD capture and JPEG capture), real-time transcoding of up to 720p, and video conferencing up to 720p.

The IVA-HD subsystem is composed of:

- Improved motion estimation acceleration engine (iME3), which is used in encoding processing
- Improved loop filter acceleration engine (iLF3), which performs deblocking filtering
- Improved sequencer (ICONT1) based on the ARM968E-S™ microcontroller. It includes memory and INTC and is used as a primary sequencer.
- Intraprediction estimation engine (iPE3). It is used in encoding processing.
- Calculation engine (CALC3), which performs transform and quantization calculations
- Motion compensation engine (MC3), which creates an interprediction macroblock with given motion vectors and modes from the reference data
- Entropy coder/decoder (ECD3), which uses Huffman and arithmetic codes during the process of encoding and decoding the stream
- Video DMA processor (ICONT2), which is also based on the ARM968E-S microcontroller and can be used as secondary sequencer
- Video DMA engine (vDMA), which is a DMA engine for data transmission between external memories and shared L2 memory
- Synchronization box (SyncBox) embedded in each hardware accelerator and in both ICONTs
- Mailbox for communication between IVA-HD and external to it processors (DSP, Cortex-A9, and Cortex-M3)
- Shared L2 interface and memory
- Video local interconnect for connection between the submodules of the IVA-HD, and between the IVA-HD and DSP subsystems
- IVA-HD system control module (SYSCTRL), which controls the clocks in the subsystem and PRCM handshaking

The IVA-HD subsystem can process three data formats for internal data: picture or slice, macroblock header, and residual data.

The IVA-HD supports the following formats:

- MPEG-1/-2/-4 such as MPEG-2 MP, ML, and MPEG-4 as SP/ASP
- Divx 5.02 and above
- Sorenson Spark (decode)

- H.263 P0 (encode and decode) and P3 (decode)
- H.264 Annex G (scalable baseline profile up to 720p)
- H.264 BL/MP/HP
- H.264 Annex H (partial)
- Stereoscopic video
- JPEG (encode/decode)
- VC-1 SP/MP/AP
- AVS-1.0
- RealVideo® 8/9/10 (decode only)
- On2® VP6.2/VP7 (decode only)

### 1.3.3 Cortex-M3 MPU Subsystem Description

The Cortex-M3 MPU subsystem includes the following components:

- Two Cortex-M3 CPUs: One for SIMCOP control, and the other for RTOS, ISP, and display subsystem control
- ARMv7-M and Thumb-2 instruction set architecture
- Dedicated INTC with up to 64 physical interrupt events
- Two-level memory subsystem hierarchy
  - L1
    - 32-KB shared cache memory
  - L2 ROM + RAM
    - 64-KB RAM
    - 16-KB bootable ROM
- Cortex-M3 system bus directly connected to the ISS interconnect
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M3

### 1.3.4 Display Subsystem Description

The display subsystem provides the control signals required to interface the OMAP system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following sections:

- Display controller: It can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into the system memory. It supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel). It allows selection of the color-depth expansion.
  - Write-back pipeline: it uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYYV, YUV4:2:2-YUV2, or YUV4:2:0-NV12, and selection of color-depth reduction from RGB24 to RGB16.
  - Two LCD outputs, each one with dedicated overlay manager, for support of passive matrix color and monochrome displays (up to 8-bit interface) and active matrix color displays (up to 24-bit interface). Secondary LCD output is available through parallel CMOS interface for MIPI®-DPI 1.0 support.
  - One TV output with dedicated overlay manager
  - Own direct memory access (DMA) engine

- Remote frame buffer interface (RFBI) module.
  - Support for MIPI-DBI protocol
  - 8-/9-/16-bit parallel interface
  - Programmable pixel modes and output formats
- Two MIPI display serial interfaces (DSIs) with the following main features:
  - Support for MIPI-DSI (four data-lane complex inputs/outputs (I/Os) for DSI1 and two data-lane complex I/Os for DSI2)
  - Support for video mode and command mode
  - Data interleaving support for synchronous and asynchronous streams
  - Bidirectional data link support
- High-definition multimedia interface (HDMI) encoder with the following main features:
  - HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
  - Deep-color mode support (10-bit for up to 1080p and up to 12-bit for 1080i/720p)
  - Support for uncompressed multichannel audio
  - Integrated high-bandwidth digital content protection (HDCP) encryption engine for transmitting protected audio and video content
  - Integrated transition minimized differential signaling (TMDS) and TER4 encoders for data island support
- NTSC/PAL video encoder with the following main features:
  - Output to on-chip video digital-to-analog converter (VDAC) providing composite analog output signal: NTSC-J, M; PAL-B, D, G, H, I; PAL-M
  - Support for square pixel sampling
  - Programmable horizontal synchronization, vertical timing, and waveforms

### 1.3.5 ABE Subsystem Description

The ABE subsystem handles audio processing for the application. It manages the audio and voice streams between the Cortex-A9 MPU subsystem and/or DSP, and the physical interfaces.

The ABE subsystem allows:

- Buffering of audio samples
- Mixing audio with voice downstream and/or microphone upstream (sidetone)
- Postprocessing of equalization, 3D effects, bass-boost

The ABE subsystem consists of:

- Audio engine (AE) subsystem, which performs real-time signal processing such as:
  - Muxing and mixing voice and data streams
  - Postprocessing operations such as sampling rate conversion, volume control, 3D effects
  - Execution of whole data transfers in the ABE subsystem using audio traffic controller (ATC)

The AE subsystem includes an AE and has the following on-chip memories available: 64-KB data memory (DMEM); 6-KB coefficient memory (CMEM); and 18-KB sample memory (SMEM).  
The ATC manages the data movement in the ABE subsystem and is in charge of interrupt generation to the DSP and Cortex-A9 MPU subsystems.
- Four general-purpose timers (GPTIMERS) and one watchdog timer (WDTIMER)
- Peripheral interfaces:
  - Three multichannel buffered serial ports (McBSPs) for inter-IC sound (I<sup>2</sup>S™) external connectivity
  - One multichannel audio serial port (McASP) supporting Sony/Philips digital interconnect format (S/PDIF) output
  - One MIPI SLIMbus interface to support new generations of MIPI-compliant components
  - One digital microphone (DMIC) for three stereo digital microphones support
  - One multichannel pulse-density modulation (McPDM) interface, which ensures communication with the TWL6040 audio companion chip
- Internal interfaces for connection with the DSP and Cortex-A9 MPU subsystems and other modules in

the device

- Dedicated power domain (ABE power domain)

### 1.3.6 ISS Description

The ISS processes data coming from the image sensor, memory, and IVA-HD subsystem. The ISS is responsible for multimedia applications such as: camera viewfinder; video record with up to 1080 p at 30 fps with digital zoom and still image processing, such as image capture up to 16 Mp with digital zoom and rotation. The ISS supports a pixel throughput of up to 200 Mp/s. It assures good performance with sensors up to 16 Mp and more (higher resolution can be achieved through multiple passes). The ISS can implement third-party algorithms for further flexibility when working with image sensors.

The ISS consists of:

- The ISP, which deals with on-the-fly or memory-to-memory data processing. It allows data collection for autoexposure, autowhite balance, autofocus, resizing, and histogram generation. The ISP consists of:
  - Image pipe interface (IPIPEIF) for synchronization signals (HD, VD) for the ISIF, IPIPE, RSZ, and hardware 3A (H3A) modules, and data transfer from video port, SDRAM, ISIF. Various pixel data manipulation functions.
  - Image pipe (IPIPE) front-end and back-end modules for raw data processing and RGB and YUV data processing, respectively. They support:
    - Sensor data linearization for dynamic range extension
    - Programmable 2D lens shading compensation correction
    - Black-level compensation
    - Gamma correction
    - RGB color correction
    - RGB to YUV4:2:2 color conversion
    - 3D look up table (LUT) for color correction
    - 2D edge enhancement
    - False chroma suppression
  - H3A for autowhite balance, autoexposure, and autofocus
  - Pattern generator (PG) for internal data generation for test purposes. It provides the ability to test some of the ISP submodules without the use of an external image sensor.
  - Two independent resizers, which allow YUV4:2:2 to YUV4:2:0 planar Chroma filtering and downsampling. The resizers support input and output flows with up to 200 Mp/s, and memory-to-memory rescaling in the range  $\times 1/4096$  scale down, and  $\times 20$  scale up.
  - Image sensor interface (ISIF) can process the incoming data and supports the following main functions:
    - Sensor data linearization
    - Supports VGA read out mode
    - Color space conversion
    - Digital clamp with horizontal/vertical offset drift compensation
    - Vertical line defect correction
    - Programmable 2D-matrix lens shading correction
    - 10-to-8 bits A-Law compression table inside
  - Buffer logic (BL), which processes and manages the requests to the module and memory subsystem
- Peripheral serial interfaces for connection with sensors and memories:
  - Two PHYs, CSIPHY1 and CSIPHY2, for physical connection to external sensors
  - Peripheral serial interfaces CSI2-A and CSI2-B/CCP2 for image data transfer from sensors to memory or ISP
- SIMCOP module for memory-to-memory operation; JPEG encode/decode hardware acceleration; high-ISO filtering; block-based rotation; warping and fusion; and general-purpose imaging acceleration. The SIMCOP includes the following main submodules:
  - Two imaging extension (iMX) modules - programmable image and video processing engines

- Noise filter 2 (NSF2) – for advanced noise filtering and edge-enhancement
- Variable-length coder/decoder for JPEG (VLCDJ) module
- Discrete cosine transform (DCT) module
- Lens distortion correction (LDC) module
- Rotation accelerator (ROT) engine
- Hardware sequencer, which offloads sequencing tasks from the MPU
- Shared buffers/memories
- DMA controller
- Timing control module for CAM global reset control, CAM flash strobe, and CAM shutter
- System interfaces and interconnects comprising:
  - Two configuration interfaces
  - One 128-bit master data interface
  - Internal ISS interconnects for image data and configuration
  - On-chip RAM interface
  - Circular buffer (CBUFF) and burst-translation engine (BTE) for efficient communication with external memory (SDRAM/TILER support)

### 1.3.7 2D/3D Graphics Accelerator Description

The 2D/3D graphics accelerator subsystem is based on POWERVR® SGX540 core from Imagination Technologies. It supports phone/PDA and handheld gaming applications. The SGX can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data processing.

The SGX subsystem has the following features:

- Universal scalable shader engine ( USSE™), multithreaded engine incorporating pixel and vertex shader functionality to reduce die area
- Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OGL2.0
- Industry-standard API supports Direct3D™ Mobile, OGL-ES 1.1 and 2.0, OpenVG™ 1.1, and OpenMAX™
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations, such as vector graphics, BLTs, ROPs, etc.
- Programmable video encode and decode support for H.264, H.263, MPEG-4 (SP), WMV9, and JPEG

### 1.3.8 Face Detect Module Description

The face detect module is a stand-alone module that performs face detection and tracking on a picture stored in the SDRAM memory. It communicates with the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems.

Face detect is typically used on:

- Video encoding
- Face-based priority auto-focusing
- Red-eye removal

The face detect module comprises:

- Face detection core with embedded DMA engine for data memory access
- RAM and ROM memories
- L3 and L4 port interfaces

### 1.3.9 On-Chip Debug Support Description

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using JTAG (IEEE1149.1) or cJTAG (IEEE1149.7) port
- Reduction of power consumption in normal operating mode
- Real-time software trace allows the OMAP software masters to transmit trace data from OS processes or tasks on 256 different channels.

The debug subsystem includes:

- IEEE1149.7 adapter
- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Processor trace subsystem
- System trace subsystem
- EMU configuration interconnect
- Cross-triggering unit (XTRIGGER)
- Debug resource manager (DRM)

ICEMelter:

- Controls the wake-up and power-down of the emulation power domain

CORE instrumentation interconnect:

- Initiator ports:
  - L3 interconnect (for software instrumentation and performance probes)
  - OCP-WP
  - IVA-HD instrumentation (HWA profiling)
  - CM2 instrumentation
- Target port:
  - EMU instrumentation interconnect

OCP watch-point (OCP-WP):

- Monitors L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Only one instance, shared among the following L3 targets:
  - GPMC
  - L4\_PER
  - L4\_CFG
 Power Management Events Profiler (PM instrumentation),  
 Clock Management Events Profiler (CM instrumentation),  
 Statistics Collector (performance probes).

### **1.3.10 Power, Reset, and Clock Management Description**

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM), based on the SmartReflex™ framework with the following features:
  - Dynamic clock gating

- Dynamic voltage and frequency scaling (DVFS)
- Dynamic power switching (DPS)
- Static leakage management (SLM)
- Adaptive body bias (ABB)
- Retention-till-access (RTA) for memories
- Clock management 1 (CM1) for clock generation, distribution, and management for the Cortex-A9 MPU, ABE, and CORE always-on power domains. The clock management allows reduction of dynamic consumption.
- Clock management 2 (CM2) for clock generation, distribution, and management for other modules

### 1.3.11 On-Chip Memory Description

The on-chip memory is divided into L3 OCM RAM, SAR ROM, SAR RAM, and memories in the subsystems (Cortex-A9, Cortex-M3, ABE, and IVA-HD).

- The L3 OCM RAM consists of 56KB of on-chip SRAM.
- The save-and-restore (SAR) ROM consists of 4KB and contains a linked list of descriptors used by the system DMA (sDMA).
- The SAR RAM consists of 8KB divided into four blocks. It is used as context-saving memory when the device goes into off mode.

### 1.3.12 Memory Management Description

The memory management is performed from:

- sDMA controller with up to 127 requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving

### 1.3.13 External Memory Interface Description

There are two main interfaces for connection to external memories: general-purpose memory controller (GPMC) and dual-channel SDRAM controller (SDRC).

The GPMC supports:

- Asynchronous SRAM memories
- Asynchronous/synchronous NOR flash memories
- NAND flash memories
- Pseudo-SRAM devices

The SDRC/EMIF allows:

- Connection between the device and LPDDR2-type memory. It supports double-data rate (DDR) and single-data rate (SDR) protocols. The EMIF is the interface between LPDDR2 SDRAM/NVM and the Cortex-A9 MPU subsystem, ISS, IVA-HD subsystem, SGX, and DMA controllers.
- PHY is the DDR physical interface, which implements data-rate conversion in compliance with LPDDR2 JEDEC requirements.

### 1.3.14 System and Connection Peripherals

The OMAP device supports a comprehensive set of peripherals to provide flexible and high-speed (HS) interfacing and on-chip programming resources.

#### 1.3.14.1 System Peripherals

- Seven GPTIMERS
- WDTIMER
- One 32-kHz synchronization timer (32KTIMER)
- System control module, which contains registers for the following functions:
  - Static device configuration

- Debug and observability
- Status
- Pad configuration
- I/O configuration
- eFuse logic
- Analog function control
- System boot decoding logic
- System mailbox with eight mailbox message queues
- One SPINLOCK module with 32 hardware semaphores, which can service tasks between the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems
- One chip-to-chip (C2C) interface, which services the communication between the OMAP device and external devices

#### **1.3.14.2 Connection Peripherals**

- Three universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces
- One UART + IrDA SIR up to FIR + TV remote control interface (CIR)
- McBSP module to provide full-duplex serial communication between the OMAP and other applications chips and codecs
- Five HS I<sup>2</sup>C™ controller modules; four of them are general-purpose modules with rates up to 3.4 Mbps, and the fifth one, in the PRCM module, performs dynamic voltage control and power sequencing with an external power IC.
- HDQ™/ 1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Two HS MMC/SD/SDIO modules with 8-bit data bus interface, that can act as an initiator on L3 interconnect thanks to an embedded DMA
- Three HS MMC/SD/SDIO modules with 4-bit data bus interface
- Six general-purpose input/output (GPIO) modules with 32 I/Os each
- One keyboard controller, which supports up to 9 × 9 matrix keypads
- One MIPI SLIMbus interface
- Four multichannel serial peripheral interface (MCSPi) modules
- One HS universal serial bus (USB) On-The-Go (OTG) module with embedded PHY, compliant with the USB2.0 (up to 480 Mbps) standard for HS functions and with the OTG supplement
- One HS multiport USB host module, which can be used for interchip connection or with an off-chip transceiver. It is compliant with the USB2.0 standard. The USB host module allows communication with USB peripherals with data rates up to 480 Mbps for HS, up to 12 Mbps for full-speed, and up to 1.5 Mbps for low-speed.
- One full-speed USB module compliant with the USB1.1 standard for full-speed functions
- One MIPI high-speed synchronous serial interface (HSI) module with two full-duplex serial communication interfaces. It is used for communication between the OMAP device and an external device, with data rates up to 192 Mbps for transmission, and up to 225 Mbps for reception. The MIPI HSI supports 16 logical channels on each destination (RX/TX).

## 1.4 Package-On-Package Concept

The OMAP4430 die uses flip-chip technology. The OMAP4430 package-on-page (POP) device supports memory stacking using a POP implementation.

The OMAP4430 die provides two LPDDR2 interfaces. Each interface supports up to two chip-selects, so up to four LPDDR2 memory dies are supported. Those interfaces are available only on device top ball out.

The two stacked memory packages are directly connected to the two LPDDR2 EMIF4D interfaces of the OMAP4430 die.

Figure 1-3 shows the concept of the POP solution, and Figure 1-4 shows stacked memory package on the POP device.

**Figure 1-3. POP Concept**

intro-003

**Figure 1-4. Stacked Memory Package on the POP Device**

intro-004

Two types of LPDDR - SDRAM memories are supported in POP package: S4 and S2 with size up to 2GB and 32-bit data width.

The POP device includes feedthroughs. The feedthroughs are defined from the bottom ball-grid array (BGA) to the stacked memory. The purpose of some of the feedthroughs is to provide power supply to the stacked memories.

## 1.5 Device Identification

[Table 1-1](#) describes the identification registers.

The identification registers include the data registers listed in [Table 1-2](#) and [Table 1-3](#). These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

**Table 1-1. Device Identification Registers**

Register Name	Alias Name	Physical Address	Address Offset	Size
STD_FUSE_DIE_ID_0[31:0]	DIE_ID[31:0]	0x4A00 2200	0x200	32
ID_CODE[31:0]	ID_CODE[31:0]	0x4A00 2204	0x204	32
STD_FUSE_DIE_ID_1[31:0]	DIE_ID[63:32]	0x4A00 2208	0x208	32
STD_FUSE_DIE_ID_2[31:0]	DIE_ID[95:64]	0x4A00 220C	0x20C	32

## 2.1 Introduction

The Cortex™-A9 microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GB space divided into several regions, depending on the target type.

The memory map comprises the following features that are shared among the initiators (for example, the Cortex-A9 MPU subsystem or the image and video accelerator [IVA-HD] subsystem).

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management controller (DMM)
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IVA-HD subsystem, graphic accelerator (SGX), etc.

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR/NAND flash and static RAM (SRAM) memories. The DMM is used for synchronous dynamic random access memory (SDRAM) memories, such as regular SDR (single-data rate)-SDRAM or mobile DDR (double-data rate)-SDRAM. For more information, see [Section 15.2, Dynamic Memory Manager](#), and [Section 15.3, EMIF Controller](#).

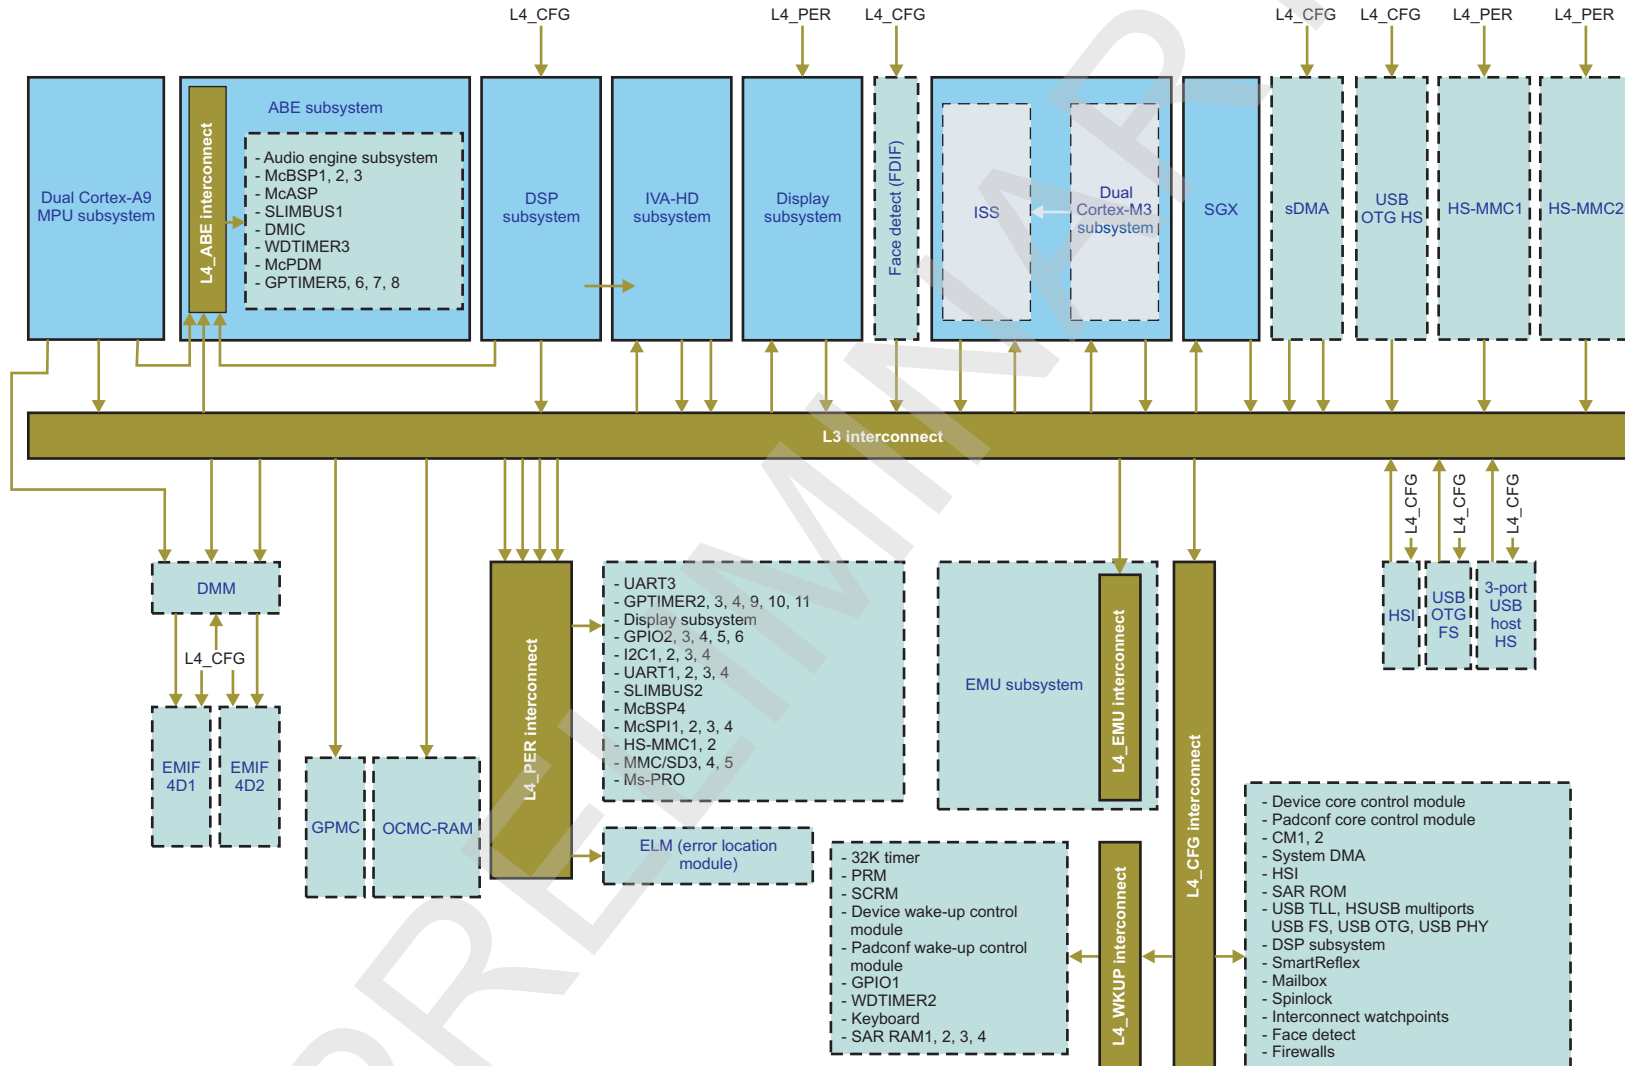

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see [Section 13.2, L3 Interconnect](#), and [Section 13.3, L4 Interconnects](#).

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview

## 2.2 L3 Memory Space Mapping

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3, and L4. L1 and L2 are memories in the Cortex-A9 MPU, Cortex™-M3 MPU, and the digital signal processor (DSP) subsystems. L3 handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3 and four L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3 interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: Four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GB address space (total address space is 4GB).
- L2: Each quarter is divided into eight blocks of 32MB, with target spaces mapped in the blocks.

This organization allows all target spaces to be decoded based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

The system has a 48-KB boot space in the on-chip boot ROM or on the GPMC space.

When booting from the on-chip ROM with the appropriate external sys\_boot pin configuration, the 48-KB memory space is redirected to the on-chip boot ROM address space [0x4002 0000 – 0x4002 BFFF].

When booting from the GPMC with the appropriate external sys\_boot pins configuration, the memory space is part of the GPMC space. At reset, the 0x0000 0000 address is available on chip-select 0(CS0) for a memory size of 16MB.

For more information about sys\_boot pins configuration, see [Section 15.4, General-Purpose Memory Controller](#), and [Chapter 27, Initialization](#).

- GPMC space:

Eight independent GPMC chip-selects (gpmc\_ncs0 to gpmc\_ncs7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (16MB, 32MB, 64MB, or 128MB) in a total memory space of 1GB.

- EMIF1/EMIF2 CS0 space:

Q2 addressing space is interleaved on two LPDDR-memory controllers (EMIF1|EMIF2), each activating its CS0 line (lpddr21\_ncs0 and lpddr22\_ncs0). These chip-selects can address 64, 128, 256, 512, 1024, and 2048MBs. Interleaving occurs from 128-byte granularity up to 512-byte granularity.

Both memories must be of the same kind (SDRAM or nonvolatile memory [NVM]) and have the same density memory device.

The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

- EMIF1/EMIF2 CS1 space:

Q3 addressing space is interleaved on two LPDDR-memory controllers (EMIF1|EMIF2), each activating its CS1 line (lpddr21\_ncs1 and lpddr22\_ncs1). These chip-selects can be programmed to 64, 128, 256, 512, and 1024MBs. Interleaving occurs at 128-MB granularity.

EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the address range programmed.

EMIF1-CS1 is disabled if EMIF1-CS0 memory density is set to 2048MB (2GBs) when interleaving is disabled, or if EMIF1-CS0 + EMIF2-CS0 memory density are set to 1024MB (1GB) when interleaving is enabled.

- Tiler space:

Q3 addressing space is also used to access the Tiler system. This space is only visible for the imaging subsystem (ISS) and display subsystem.

[Table 2-1](#) describes the global memory space mapping.

**Table 2-1. Global Memory Space Mapping**

Quarter	Module Name	Start Address (hex)	End Address (hex)	Size	Description

## 2.3 L4 Memory Space Mapping

Four L4 interconnects handle transfers with peripherals. Each interconnect is in a distinct power domain:

- L4\_CFG: CORE power domain
- L4\_WKUP: WKUP power domain
- L4\_PER: PER power domain
- L4\_ABE: ABE power domain

As with the L3 interconnect, the L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

### 2.3.1 L4\_CFG Memory Space Mapping

The L4\_CFG interconnect is a 16-MB space composed of the L4\_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4\_CFG interconnect.

**NOTE:** All memory spaces described as modules provide direct access to module registers outside the L4\_CFG interconnect. All other accesses are internal to the L4\_CFG interconnect.

**Table 2-3. L4\_CFG Memory Space Mapping**

### 2.3.2 L4\_WKUP Memory Space Mapping

The L4\_WKUP interconnect is a 256-KB space composed of the L4\_WKUP interconnect configuration registers and the module registers.

[Table 2-4](#) describes the mapping of the registers for the L4\_WKUP interconnect.

**NOTE:** All memory spaces described as modules provide direct access to module registers outside the L4\_WKUP interconnect. All other accesses are internal to the L4\_WKUP interconnect.

**Table 2-4. L4\_WKUP Peripheral Space Mapping**

**NOTE:** 8-bit and 16-bit peripherals are aligned on 32-bit address boundaries.

### 2.3.3 L4\_PER Memory Space Mapping

The L4\_PER interconnect is a 16-MB space composed of the L4\_PER interconnect configuration registers and the module registers.

Table 2-5 describes the mapping of the registers for the L4\_PER interconnect.

**NOTE:** All memory spaces described as modules provide direct access to the module registers outside the L4\_PER interconnect. All other accesses are internal to the L4\_PER interconnect.

**Table 2-5. L4\_PER Memory Space Mapping**

Module Name	Start Address (hex)	End Address (hex)	Size	Description
L4_PER	0x4800 0000	0x4800 07FF	2KB	Address protection (AP)

### 2.3.4 L4\_ABE Memory Space Mapping

The L4\_ABE interconnect is a 16-MB space composed of the L4\_ABE interconnect configuration registers and the module registers.

ABE modules are dual-mapped inside the Cortex-A9 MPU/DSP address space:

- Mapped in L3 as the L4 ABE space
- Mapped in Cortex-A9 MPU and DSP nonshared device map

---

**NOTE:** All memory spaces described as modules provide direct access to the module registers outside the L4\_ABE interconnect. All other accesses are internal to the L4\_ABE interconnect.

---

Table 2-6 describes the mapping of the registers for the L4\_ABE interconnect in the Cortex-A9 MPU nonshared (private) device address range (L4\_ABEP).

**Table 2-6. ABE Cortex-A9 MPU Memory Space Mapping**

## 2.5 DSP Subsystem Memory Space Mapping

The DSP subsystem can access the ABE and IVA-HD blocks.

ABE has three different address spaces:

- **ABE NC:** This region is for accesses to registers in ABE. For more information about ABE peripheral memory mapping, see [Table 2-6](#).
- **ABE:** This region is for accesses to memory in ABE. Memory in the ABE subsystem can be cached in DSP L1 and L2. When enhanced direct memory access (EDMA) tries to access this space, L1/L2 is snooped and if data is present in DSP subsystem caches, data is provided to EDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to ABE and data returned is not allocated into DSP cache; instead, it is sent to EDMA.
- **ABE locked region:** This region is similar to the ABE region, except that data from ABE is allocated into DSP caches and returned to EDMA.

The IVA-HD region is for accesses to IVA-HD accelerator memories and registers in IVA-HD. SL2 is the L2 cache in IVA-HD. There are three ways to access the IVA-HD accelerator memories:

- **SL2 -> L1 region:** This region is for accesses to SL2 memory that can be mapped to DSP L1. When EDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to EDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L1 cache; instead, it is sent to EDMA.
- **SL2 -> L2 region:** This region is for accesses to SL2 memory that can be mapped to DSP L2. When EDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to EDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L2 cache; instead, it is sent to EDMA.
- **SL2 locked region:** This region is similar to the previous regions, except that data is allocated into DSP caches and returned to EDMA.

[Table 2-10](#) describes the mapping of the registers for the DSP subsystem.

**Table 2-10. DSP Subsystem Memory Space Mapping**

## 2.6 Display Subsystem Memory Space Mapping

The display subsystem integrates a display controller (DISPC), a remote frame buffer interface (RFBI), two MIPI® display serial interfaces (DSI1 with four data lanes, and DSI2 with two data lanes), an HDMI link with its PHY (high-definition multimedia interface, digital part), and a video PAL/NTSC encoder (VENC) with video DAC (and TV out buffer).

The DISPC is connected through an interconnect master port to the L3 interconnect and has its own DMAs to fetch the data from the system memory.

There are two views (from the L3\_PER and L4\_PER interconnects) of the display subsystem memory space mapping.

### 2.6.1 L3 Interconnect View of the Display Memory Space

[Table 2-11](#) lists the display subsystem memory space mapping from the perspective of the Cortex-A9 MPU subsystem through the L3 interconnect.

**Table 2-11. L3 Access – Display Subsystem Space Mapping**

## 3.1 Device Power Management Introduction

Power management (efficient use of the limited battery resources on a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible length of time.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

### 3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage management.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or a common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager takes into consideration the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

---

**NOTE:** In the following sections, the term *module* is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

---

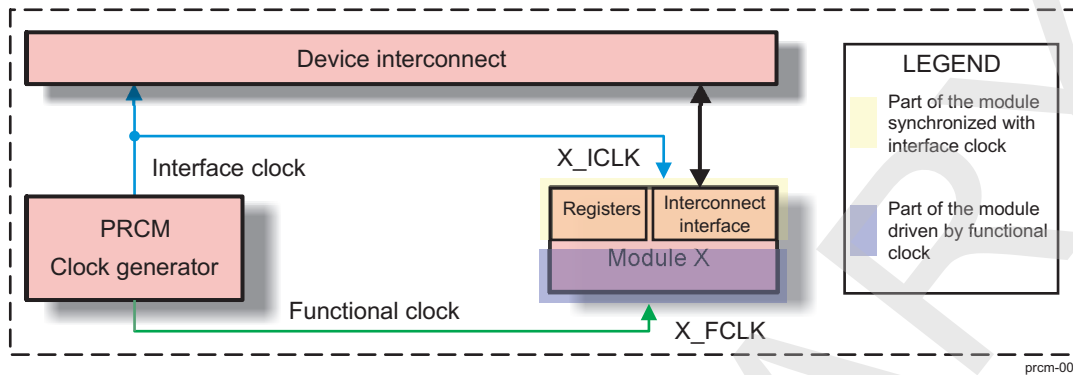

#### 3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

##### 3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see [Figure 3-1](#)).

Figure 3-1. Functional and Interface Clocks

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or a subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is directly distributed to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

**NOTE:** At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed either by a PRCM module functional clock output, or by a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

### 3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be *active* when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

#### Master standby protocol:

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, and the PRCM module can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, the software must configure the clock management behavior for the module. This is done by setting the module register bit field **<Module>\_SYSCONFIG.MIDDLEMODE** or **<Module>\_SYSCONFIG.STANDBYMODE**, as presented in [Table 3-1](#). The behavior, identified by standby mode values, must be configured.

**Table 3-1. Master Module Standby Mode Settings**

Standby Mode Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent any loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view as it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wakeup-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

**NOTE:**

- Smart-standby mode is the preferred mode of operation, while forced-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in [Table 3-1](#). See the power management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the **CM\_<Power domain>\_<Module>\_CLKCTRL[x].STBYST** bit in the PRCM module. [Table 3-2](#) describes the master module standby status.

**Table 3-2. Master Module Standby Status**

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

[Table 3-3](#) lists the enabling conditions for the master module clocks managed by the standby protocol.

**Table 3-3. Master Module Clock Enabling Conditions**

Relation	Condition
AND	Clock domain is ready.
OR	Master module standby request is deasserted.

**Table 3-3. Master Module Clock Enabling Conditions (continued)**

Relation	Condition
	Master module wake-up request is asserted.

**Slave Idle protocol:**

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or as a result of an event (called a wake-up event, for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up.

Although the protocol is completely hardware-controlled, software must configure the clock management behavior for the slave module. This is done by setting the module register bit field **<Module>\_SYSCONFIG.SIDLEMODE** or **<Module>\_SYSCONFIG.IDLEMODE**, as presented in [Table 3-4](#). The behavior, identified by the Idle Mode Value column, must be configured by software.

**Table 3-4. Module Idle Mode Settings**

Idle Mode Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent any loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view as it ensures the clocks remain active; however it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to an efficient system power management.
0x3	Smart-idle wakeup-capable mode	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in idle state. The mode is relevant only if the appropriate module wakeup output(s) is implemented.

**NOTE:**

- Smart-idle mode is the preferred mode of operation, while forced-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in [Table 3-4](#). See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the **CM\_<Power domain>\_<Module>\_CLKCTRL[x] IDLEST** bit field in the PRCM module. [Table 3-5](#) lists the possible idle statuses for a slave module.

**Table 3-5. Slave Module Idle Status**

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.

**Table 3-5. Slave Module Idle Status (continued)**

IDLEST Bit Value	Idle Status	Description
0x3	Full idle	The module is fully idle. the interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the idle request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, the software must configure the **<Module>\_SYSCONFIG[x] CLOCKACTIVITY** bit field.

The CLOCKACTIVITY setting is used internally by the module to determine on which part of the module the conditions to acknowledge the PRCM module idle request is tested. As an example, if the functional clock must remain active when the module is in idle mode, then the module must acknowledge PRCM module idle request by only considering the interface clock gating conditions (that is, there is no pending activity on the interconnect).

**NOTE:** See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with the smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. [Table 3-6](#) describes the possible CLOCKACTIVITY settings for a module:

**Table 3-6. Slave Module Clock Activity Settings**

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgement. This setting also means both clocks may be gated upon a PRCM module idle request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the idle request without checking the internal functionalities linked to its clocks.

(1) Optional if it concerns all features.

**NOTE:**

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in [Table 3-6](#).

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

**CAUTION**

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure a consistent programming between the CLOCKACTIVITY settings of the module and the PRCM module clock gating control bits. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For the idle protocol management on the PRCM module side, the behavior of PRCM module is configured in the CM\_<Power domain>\_<module>\_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the idle request to the module either unconditionally (that is, immediately when the software requests), or through hardware control when the module idle conditions are satisfied. Table 3-7 describes the configurable behavior of MODULEMODE.

**Table 3-7. Slave Module Mode Settings in PRCM**

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can only react to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).
0x1	Auto	This mode applies to a module when the PRCM module only manages its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can only gate the interface clock to the module.
0x3	Reserved	Not available.

**NOTE:** The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM\_<Power domain>\_<module>\_CLKCTRL[x] MODULEMODE bit field description for the module to identify the supported settings.

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the Idle protocol.

**Table 3-8. Slave Module Interface Clock Enabling Conditions**

Relation	Condition
AND	Clock domain is ready.
	OR
	Slave module idle status is 0x0 (fully functional).
	Slave module idle status is 0x1 (in transition).
	Slave module wake-up request is asserted.

**Table 3-9. Slave Module Functional Clock Enabling Conditions**

Relation	Condition
AND	Clock domain is ready.
	OR
	Slave module idle status is 0x0 (fully functional).
	Slave module idle status is 0x1 (in transition).
	Slave module idle status is 0x2 (interface clock is idled).
	Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

**NOTE:** A given clock can be used by more than one module. Clock enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

### Module wake-up request:

In IDLE state, a slave module may have to wake-up to generate an interrupt or a DMA request. This may be the result of an external request (for example, to the I/O port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WDTIMER time-up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

**NOTE:** See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

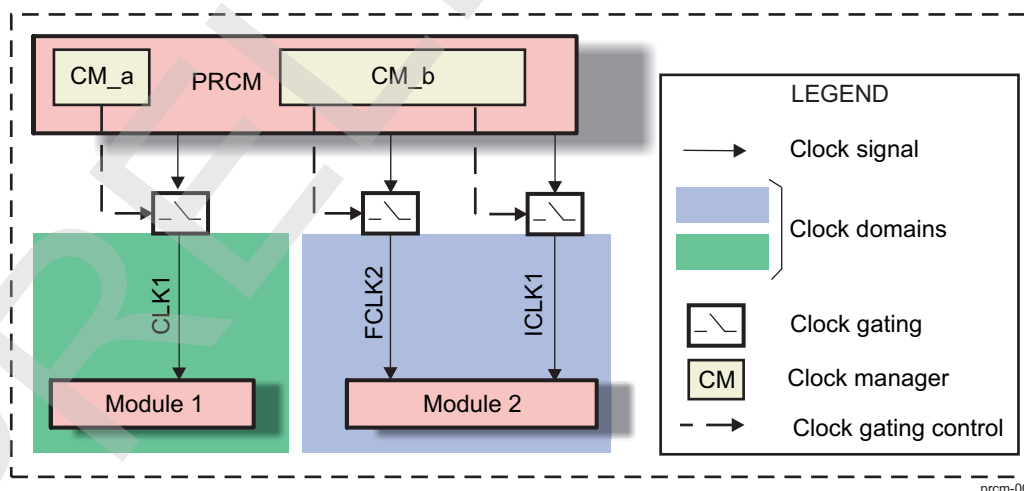

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock domain level, as explained in [Section 3.1.1.1.3](#).

#### 3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see [Figure 3-2](#)). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE (Gated) states). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

**Figure 3-2. Generic Clock Domain**

[Figure 3-2](#) presents an example of two clock managers: CM\_a and CM\_b. Each clock manager manages a clock domain. The clock domain of CM\_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM\_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM\_<Clock domain>\_CLKSTCTRL[x] CLKACTIVITY\_<FCLK/Clock name\_FCLK> bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

**Table 3-10. Clock Domain Functional Clock States**

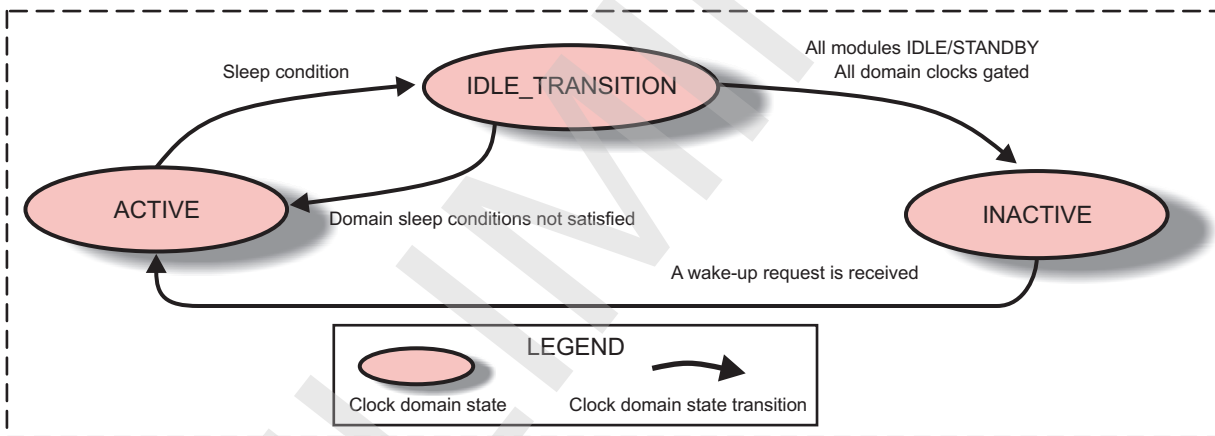

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

**3.1.1.1.4 Clock Domain-Level Clock Management**

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE\_TRANSITION, or INACTIVE. Figure 3-3 identifies the sleep and wake-up transitions of the clock domain between the ACTIVE and INACTIVE states.

**Figure 3-3. Clock Domain State Transitions**

prcm-003

Table 3-11 defines the clock domain states.

**Table 3-11. Clock Domain Clock States**

State	Description
ACTIVE	<ul style="list-style-type: none"> <li>Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state.</li> <li>All functional clocks to the active slave modules (that is, not idled) of the clock domain are provided.</li> <li>All interface clocks to the nondisabled slave modules in the clock domain are provided.</li> <li>All functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided.</li> <li>Every enabled optional clocks to the modules in the clock domain are provided.</li> </ul>
IDLE_TRANSITION	<p>This is a transitory state.</p> <ul style="list-style-type: none"> <li>Every master module in the clock domain is in STANDBY state.</li> <li>Every idle request to all the slave modules in the clock domain is asserted.</li> <li>The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active.</li> <li>Every enabled optional clocks to the modules in the clock domain are provided.</li> </ul>

**Table 3-11. Clock Domain Clock States (continued)**

State	Description
INACTIVE	<p>All clocks within the clock domain are gated.</p> <ul style="list-style-type: none"> <li>• Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled or auto) is in IDLE state and set to disabled or auto mode.</li> <li>• Every master module in the clock domain is in STANDBY state.</li> <li>• Every optional functional clock in the clock domain is gated.</li> </ul>

Each clock domain transition behavior is managed by an associated register bit field in the CM\_<Clock domain>\_CLKSTCTRL[x] CLKTRCTRL PRCM module.

[Table 3-12](#) describes the clock domain clock transition mode settings.

**Table 3-12. Clock Domain Clock Transition Mode Settings**

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, irrespective of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see <a href="#">Table 3-14</a> ).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, irrespective of the hardware conditions identified in <a href="#">Table 3-13</a> .
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see <a href="#">Table 3-14</a> and <a href="#">Table 3-13</a> ).

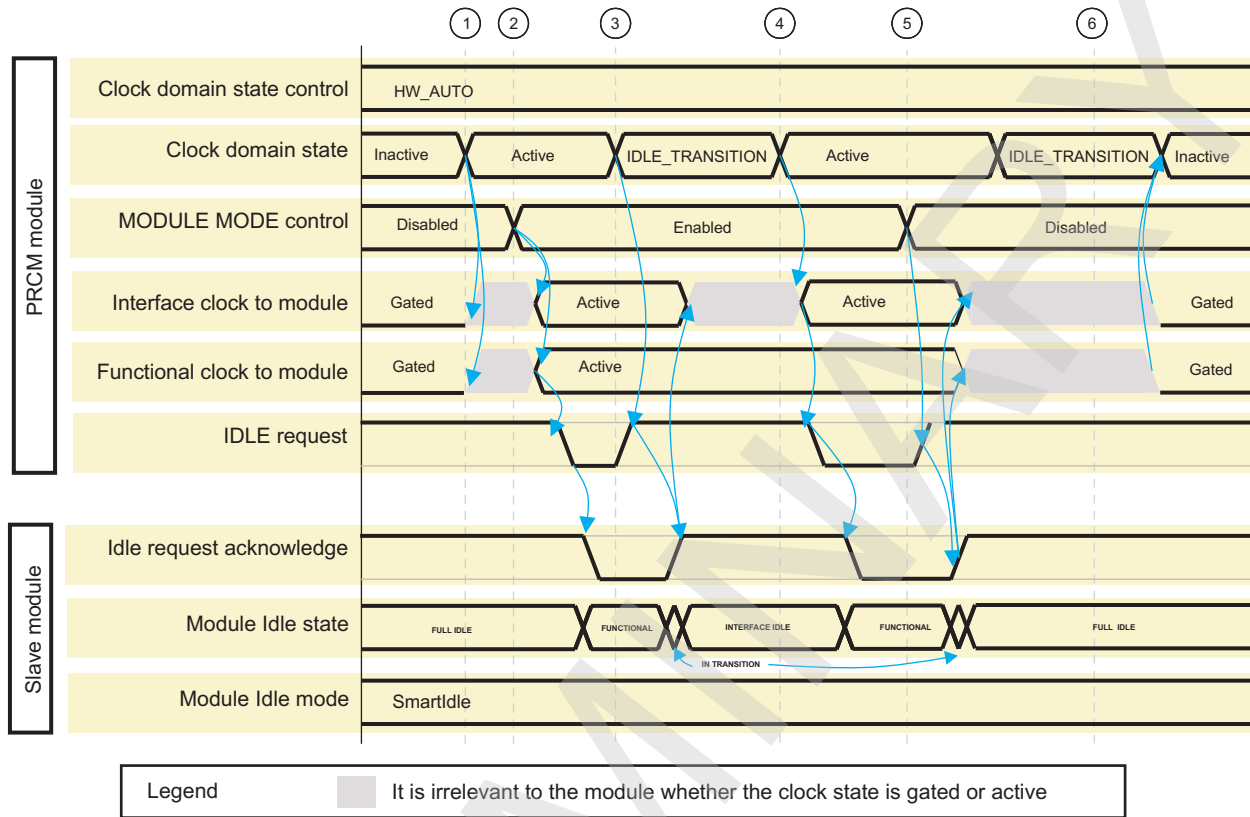

**NOTE:** Depending on the characteristics of a clock domain, it may or may not support all the clock transition mode settings described in [Table 3-12](#). See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

### 3.1.1.1.5 Clock Domain HW\_AUTO Mode Sequences

The sequence diagrams in [Figure 3-4](#) through [Figure 3-6](#) identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They highlight the changes in the module state based on the changes to the clock domain state and module mode settings.

[Figure 3-4](#) highlights the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: Disabled and Enabled.

**Figure 3-4. Clock Domain/Slave Module Clock-Management Interaction Sequence 1**

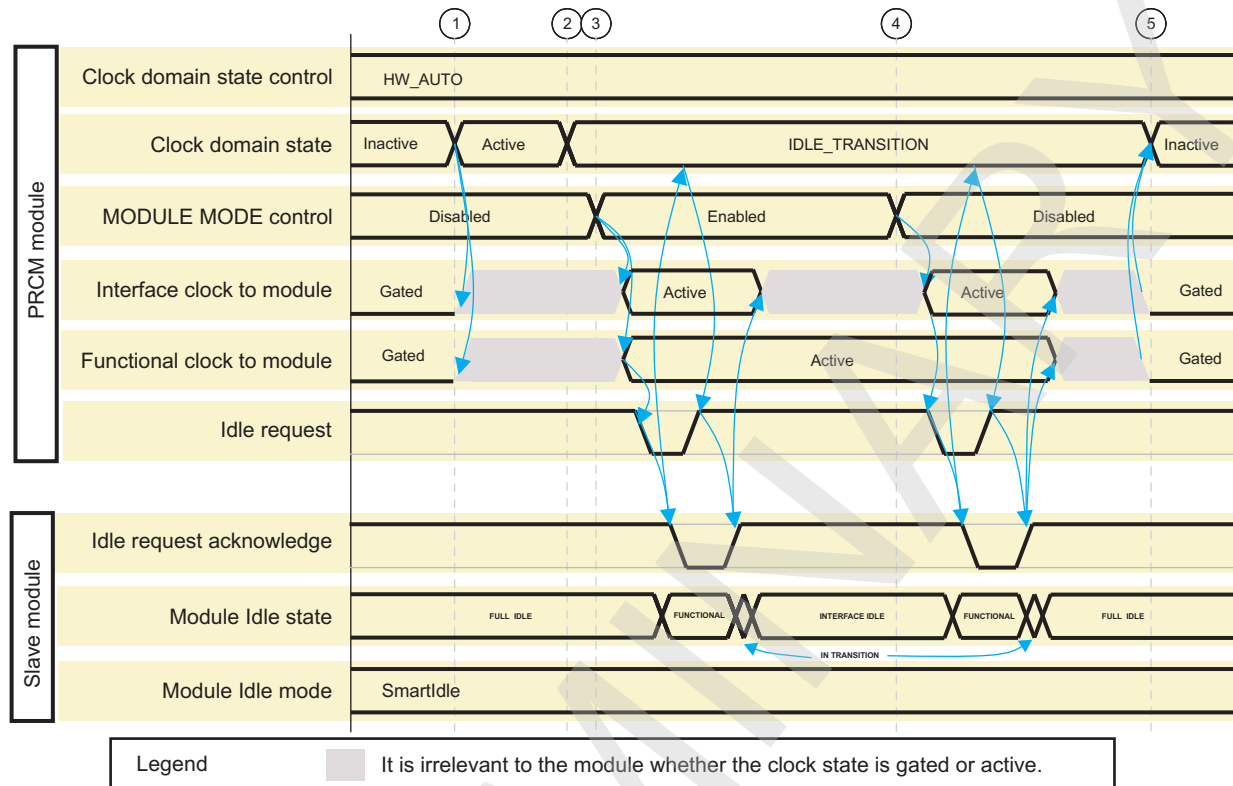

prcm-004

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes state to Active. As the Module Mode control is still Disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. Software changes the module mode to Enabled. The clocks to the module are restarted automatically. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake. The module Idle state is functional. If the module is enabled before the clock domain wakes up, Steps 1 and 2 are simultaneous.
3. The clock domain switches to IDLE\_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled as the module is in Enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to the IDLE\_TRANSITION state. When the clock domain sleep transition conditions are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-5 highlights the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is Idle\_Transition.

**Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 2**

prcm-005

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes state to Active. As the Module Mode control is Disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE\_TRANSITION state. As the Module Mode control is Disabled, this event has no effect on the module state.
3. Software changes the module mode to Enabled. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clock.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-6 highlights the behavior of a slave module receiving only interface clock and supporting the configurable Auto module mode.

**Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 3**

prcm-006

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes state to Active. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake, that is, the module Idle state is functional.
2. The clock domain switches to the IDLE\_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted if applicable, then the module is put out of IDLE state.
4. Same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is under IDLE state and its clock is gated.

### 3.1.1.1.6 Clock Domain Sleep/Wakeup

The clock domain manager initiates a domain wake-up transition when the conditions listed in [Table 3-13](#) are satisfied.

**Table 3-13. Clock Domain Wake-Up Conditions**

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set. (CLKTRCTRL = 0x2)
	At least one wake-up request asserted by one of the modules of the clock domain.
	At least one dynamic dependency <sup>(1)</sup> from another clock domain is active.
	At least one static dependency <sup>(1)</sup> from another clock domain is active.
	At least one wake-up dependency <sup>(1)</sup> from a module in another clock domain is active.

(1) The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7](#), *Clock Domain Dependency*.

The clock domain manager initiates a domain sleep transition when the conditions listed in [Table 3-14](#) are satisfied.

**Table 3-14. Clock Domain Sleep Conditions**

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency <sup>(1)</sup> from any other domain is active.
		No wake-up dependency <sup>(1)</sup> from any module in another domain is active.
OR		The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
	AND	The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).
		No static domain dependency <sup>(1)</sup> from any other domain is active

(1) The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7](#), *Clock Domain Dependency*.

### 3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain may support the types of clock domain dependencies described in the following subsections.

#### 3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from domain A module toward a module in any other domain. For example, CD\_DSP can have a static dependency with CD\_L3\_1 because this domain has the L3 interconnect to carry the transactions from the DSP module.

This static dependency consists of forcing clock domain B to stay active, as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can only be gated if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting CM\_<Source Clock domain>\_STATICDEP[x] <Destination Clock domain>\_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

#### 3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if all modules between clock domains A and B are quiet for a given sampling delay, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled L4 clock whose frequency is configured by setting the `CM_DYN_DEP_PRESCAL[5:0]` PRESCAL bit field. The prescaled clock frequency is given as:

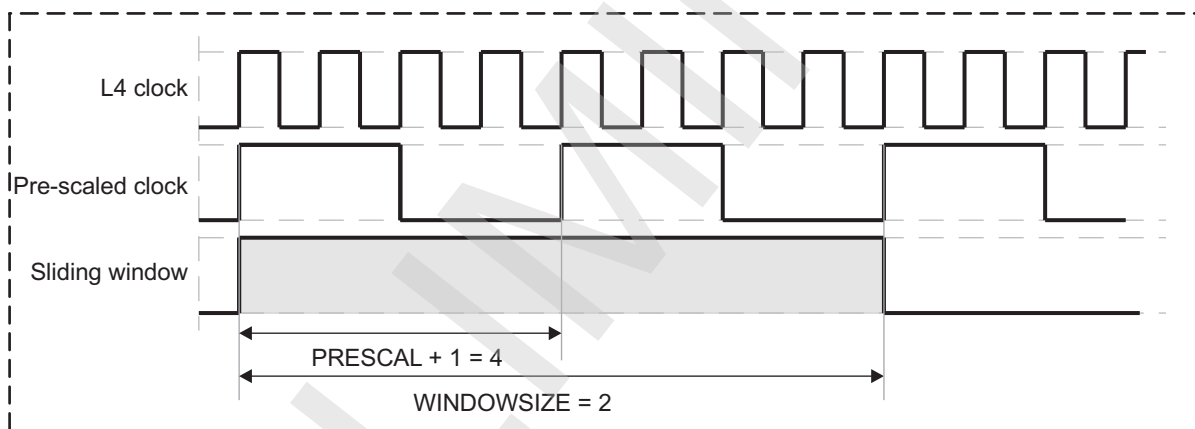

$$\text{Prescaled clock frequency} = \text{L4 interface clock frequency} / (\text{PRESCAL} + 1)$$

The size of the sliding window is fixed by setting the `CM_<Clock domain>_DYNAMICDEP[27:24]` WINDOWSIZE bit field. It is given as:

$$\text{Sliding window duration} = \text{WINDOWSIZE} \times \text{Period of Prescaled clock cycle}$$

Figure 3-7 presents an example of the sliding window duration equal to eight clock cycles of L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

**Figure 3-7. Sliding window for Dynamic Dependency**

prcm-007

This dynamic dependency is also referred to as the autosleep/autowake-up feature.

**NOTE:**

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when:

- At least one master module or a slave interconnect module from clock domain A to domain B is active (that is, the master module is not in STANDBY state and/or the interconnect slave module is not in IDLE state), and
- There has been one or more transaction on the interconnect within the sliding window duration.

It is said to be inactive otherwise.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only `CM_<Source Clock domain>_DYNAMICDEP[x]` <Destination Clock domain>\_DYNDEP bit.

### 3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals, toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module not only activates its clock domain, but also the clock domain of the servicing module.

---

**NOTE:** The wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced, to ensure that clock domain of the servicing module remains active.

---

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be one of following types:

- Interrupt request to microprocessor (MPU) or digital signal processor (DSP) interrupt controller (INTC)
- DMA request to a DMA controller

Upon wakeup by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a standalone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active

---

**NOTE:** For slave modules, the static and dynamic dependencies of a clock domain are not impacted by its wake-up dependency settings. For master modules, the static dependencies are not impacted.

Hence, in addition to the activation of the clock domains identified in [Section 3.1.1.1.7.3](#) above, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the waking up clock domain through dynamic dependencies are only activated if a transaction is initiated to these clock domains.

---

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM\_<Power domain>\_<Originator Module>\_WKDEP[x] WKUPDEP\_<Originator Module>\_<Servicing Module> bit of the PRCM module. Where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. <Servicing Module> refers to the module servicing the wake-up event.

---

**NOTE:** When only one event type is associated with the wake-up signal of a slave module, the WKUPDEP wake-up dependency for the module clock domain is not be configurable and may be hardwired in the PRCM module.

In case of the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

---

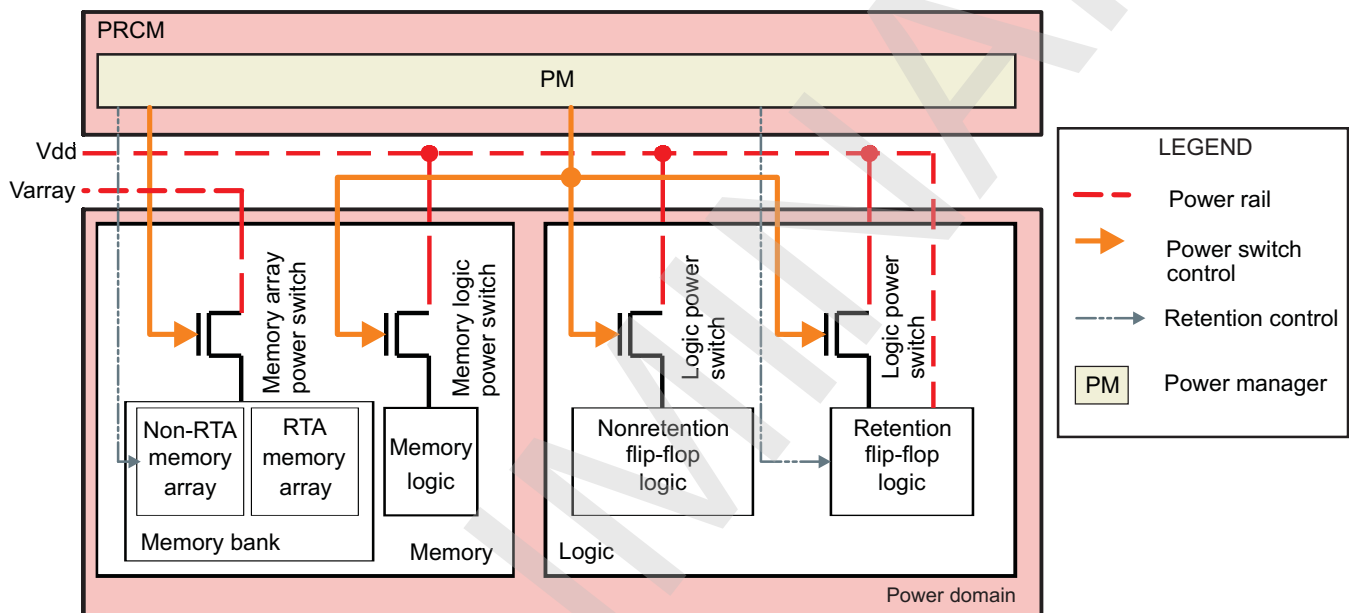

### 3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. The power to the modules can be switched off when they are not in use to minimize device power consumption. Independent power control of sections of the device allow the PRCM module to turn on and off specific sections of the device without affecting the others.

#### 3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with independent and dedicated power manager (see Figure 3-8). A power domain can be turned on and off without affecting the other parts of the device.

Figure 3-8. Generic Power Domain

prcm-008

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into some logic area and some memory area.

The memory area contains two entities:

- Memory bank: The memory bank is composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches). The memory array within the memory bank can be of RTA (retention-till-access), see Section 3.1.1.2.3, *Module Logic and Memory Context* or nonRTA type.
- Memory logic: The memory logic is powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches).

The logic area in the power domain can also be split between retention flip-flops (RFFs) or nonretention flip-flops (DFFs).

Table 3-15 lists the possible states and substates of the logic area in a power domain.

Table 3-15. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTIO N	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.

**Table 3-15. States of a Logic Area in a Power Domain (continued)**

State	Substate	Description
	OSWR (open switch retention)	Logic is powered down, except the RFF-based logic retains its value. The DFF is lost and reset. Vdd can be lowered to its retention voltage level if all power domains associated are in this or lower states.
OFF		Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state.

**NOTE:** A power domain that does not have RFF logic may still support the open-switch retention power state. In this case, all its logic context is lost, yet its memory area context may remain valid if programmed to retention mode (see [Table 3-16](#) and [Table 3-19](#)).

The RETENTION state is useful for quick switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state power consumption is less than in On Power state.

Similarly, in RETENTION state the CSWR state has the advantage of faster turn-on times over the OSWR state, because in the latter case the entire context is maintained. However, CSWR state has the disadvantage of higher leakage currents over OSWR state.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module, or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate the memory array power state changes when the associated power domain is in On Power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states identified in [Table 3-16](#).

**Table 3-16. States of a Memory Area in a Power Domain**

State	Description
ON	The memory array is powered and fully functional. Additionally, the RTA feature may put part or all of the memory array automatically into retention when not accessed, if this feature exists and is enabled on a given memory instance.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention either through applicable direct retention control signal, or automatically if the RTA feature exists and is enabled on a given memory instance. Data in memory are always retained.
OFF	The memory array is powered down. Data in memory are lost.

### 3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic area or the memory area, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM\_<Clock Domain Name>\_<Module Name>\_CONTEXT register provides the status of the device logic and memory context.

- The module logic context is made of simple flip-flops (DFFs) if module has no logic RFFs.
- If module has logic retention (full or partial), it is assumed that the context is made only of RFFs.

**NOTE:** The display subsystem (DSS) is an exception where the status of DFF and RFF context is presented, because only HMDI keys are retained, while most of the DSS is nonretained.

These context status bits must be cleared by software.

### 3.1.1.2.3 Retention-Till-Access Memory Feature

Most high-density memories within the device support the RTA feature. It consists of automatically putting part of or the entire memory array into retention when no access is made to the corresponding locations. This is managed within the memory bank by hardware and is completely transparent to the user software. As a consequence, RTA memories do not have any retention mode control signal coming from the PRCM module.

The RTA feature is controlled (enabled and disabled) from:

- eFuse bits configuration in the system control module, automatically loaded to the PRCM module.
- Software-controlled override capability through a bit field per voltage domain in the PRCM module (that is, PRM\_LDO\_SRAM\_<Memory Voltage Domain>\_SETUP[0] DISABLE\_RT\_A\_EXPORT).
- Hardware override capability controlled by the PRCM module through control of embedded static random-access memory (SRAM) low-dropout linear regulator (LDO) controller.

### 3.1.1.2.4 Power Domain Management

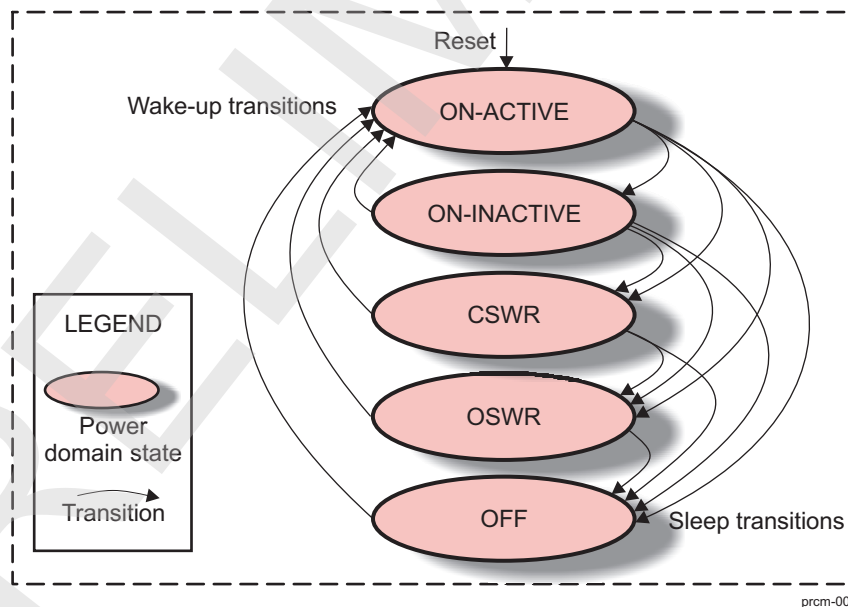

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to OSWR RETENTION state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in INACTIVE state: All modules in the domain are in IDLE or STANDBY state, and there is no constraining dependency (static, dynamic, or wake-up dependency) between the clock domains blocking the clock domain sleep transition.

Figure 3-9 shows all possible power domain state transitions.

Figure 3-9. Power Domain Transitions

Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE, CSWR, OSWR, or OFF) to ON-ACTIVE is always direct. For example, user software cannot request a power domain transition from OSWR state to CSWR state, but only to ON-ACTIVE state.

The power domain manager initiates a power domain wake-up transition when the conditions listed in Table 3-17 are satisfied.

**Table 3-17. Power Domain Wake-Up Conditions**

Relation	Condition
AND	Voltage domain is on.
	OR
	There is at least a wake-up condition for one enclosed functional clock domain.
	There is a request for clock generation or distribution enclosed in the power domain.
	There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in [Table 3-18](#) are satisfied.

**Table 3-18. Power Domain Sleep Conditions**

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

[Table 3-19](#) lists the PRCM module power domain control and status features.

**Table 3-19. Power Domain Control and Status Registers**

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION.
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper LOW-POWER state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the Power domain logic is in CSWR or OSWR RETENTION state when the domain transitions to RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON or RETENTION state when the power domain is in RETENTION state. The memory bank can not be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in ON, RETENTION, or OFF state when the power domain is in ON state.
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power domain power state transition is in progress or there is no ongoing transition.
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON. For memory with RTA feature, the ON and RETENTION memory states are equivalent.

### 3.1.1.3 Voltage Management

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the device power consumption according to the performance criteria defined. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

### 3.1.1.3.1 Voltage Domain

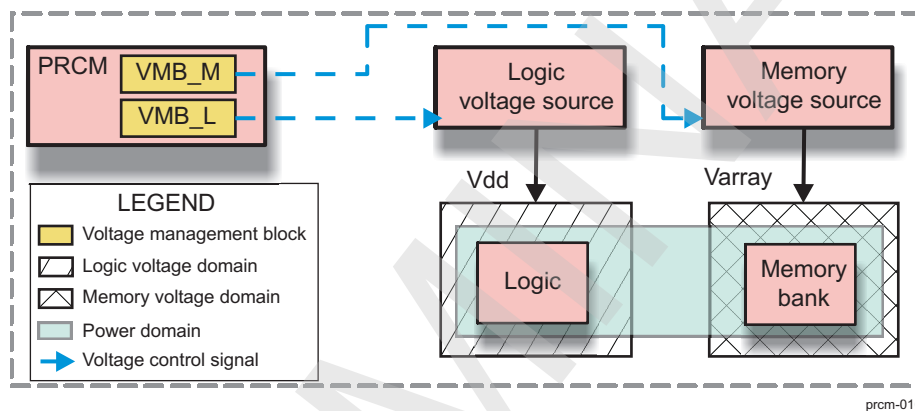

A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain, independently of other voltage domains of the device.

The voltage managers in the PRCM module can be of two types:

- Dynamically configurable by software to scale the domain voltage level to specific values within the device operational voltage range. This is called adaptive voltage scaling (AVS).
- Hardware controlled to automatically switch the domain voltage levels according to the associated hardware conditions.

Figure 3-10 shows a voltage domain.

Figure 3-10. Generic Voltage Domain

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are idle (that is, have no ongoing transaction), the domain voltage can be lowered to reduce power consumption and then switched back to normal operating voltage level when a wake-up event is received by one of the modules of the voltage domain. Similarly, when a memory bank is not in use, it may be switched to retention or off voltage levels to ensure power savings.

Table 3-20 describes the different states of the logic voltage domain.

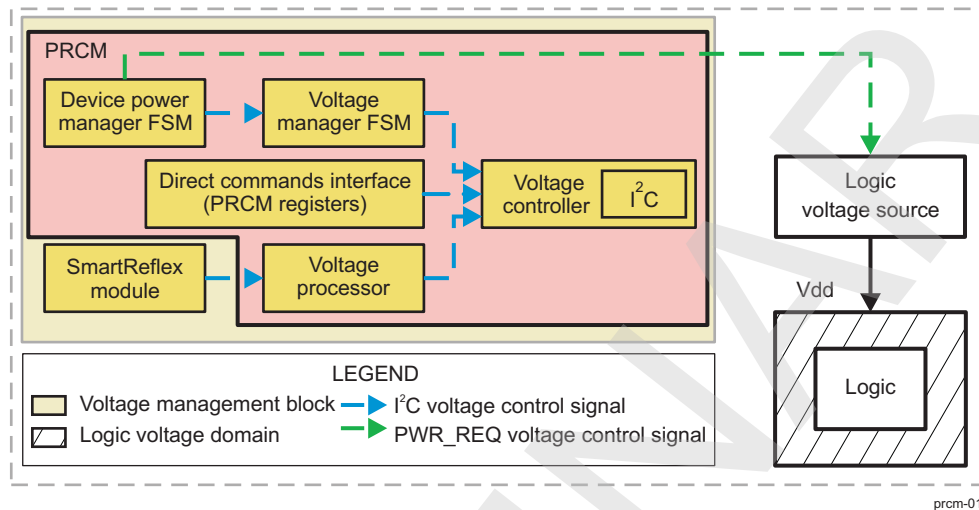

Table 3-20. States of Logic Voltage Domain

State	Description
ON	The voltage regulator source for the voltage domain is active and operating in its normal voltage range for the current operating performance point (OPP) and can deliver up to the maximum load current defined for the current OPP.
SLEEP	The voltage regulator source is operating in its normal voltage range but it can only deliver a limited load current (no logic activity on this voltage domain). In sleep mode, regulator power consumption is reduced.
RETENTION	The voltage regulator source is operating at retention voltage level. It delivers the minimal load current required to maintain the voltage domain logic context.
OFF	The voltage regulator source is inactive and its output voltage is 0 volts. No supply current is provided in this mode.

### 3.1.1.3.2 Voltage Domain Management

Figure 3-11 highlights the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the device logic voltage domains.

**Figure 3-11. Generic Logic Voltage Management**

#### 3.1.1.3.2.1 Logic Voltage PWR\_REQ Voltage Control

A PWR\_REQ signal is deasserted when the device enters the OFF state. The external power integrated circuit (IC) can use it to properly manage turn-off or turn-on of the logic voltage source.

#### 3.1.1.3.2.2 Logic Voltage I<sup>2</sup>C Voltage Control

The PRCM module allows three voltage control paths to a dedicated inter-integrated circuit (I<sup>2</sup>C™) interface for the logic voltage domains managed by it.

1. The PRCM module hardware-managed voltage changes from device power manager voltage finite state-machine (FSM) through voltage manager FSM based on hardware conditions. It sends the voltage commands when the device enters in RETENTION or OFF state and upon device wakeup.
2. Direct control by user software through the PRCM module registers for voltage scaling.
3. Adaptive voltage scaling (see [Section 3.1.1.3.3, AVS Overview](#)) with SmartReflex™ voltage control commands through the voltage processor.

---

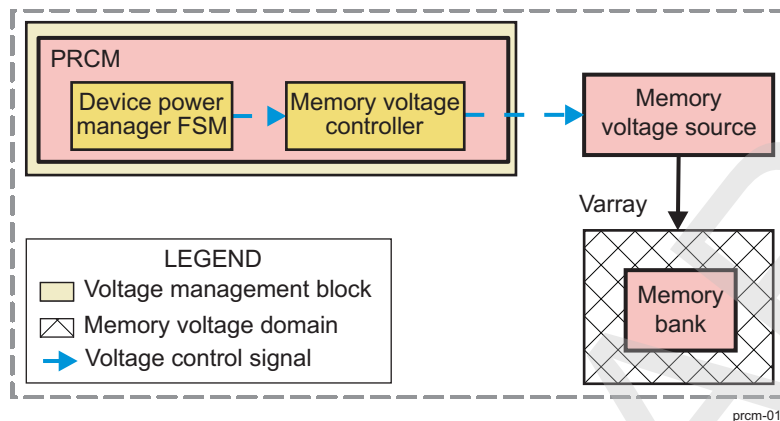

**NOTE:** An I<sup>2</sup>C host module (not controlled by the PRCM module) can be used to program the external power IC. Because this procedure completely bypasses PRCM module, see [Section 23.1 I<sup>2</sup>C](#).

---

Figure 3-12 highlights the voltage control path available within a generic memory voltage management block to control the voltage supply to the device memory voltage domains.

**Figure 3-12. Generic Memory Voltage Management**

The PRCM hardware supports automatic scaling down of the memory array supply whenever they transition to RETENTION or OFF power state. The Device power manager FSM manages the voltage scaling of memory voltage domains through memory voltage controller (or LDO).

### 3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used for controlling the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power-supply voltage is adapted to the silicon performance in two ways:

- Statically adapted to the manufacturing process of a given device
- Dynamically adapted to the temperature-induced current performance of the device

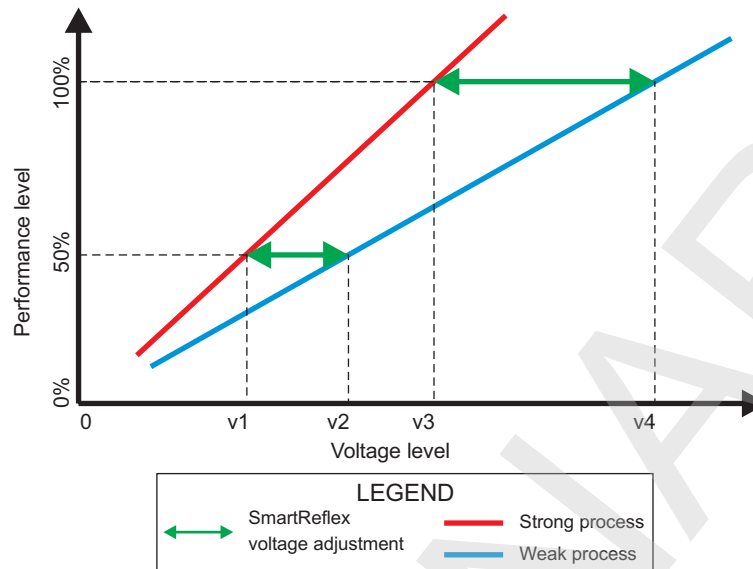

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

The static correction of the device voltage level (see [Figure 3-13](#)) is based on the desired performance level and silicon performance characteristics of the device. Due to process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

[Figure 3-13](#) identifies the fact that, with SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

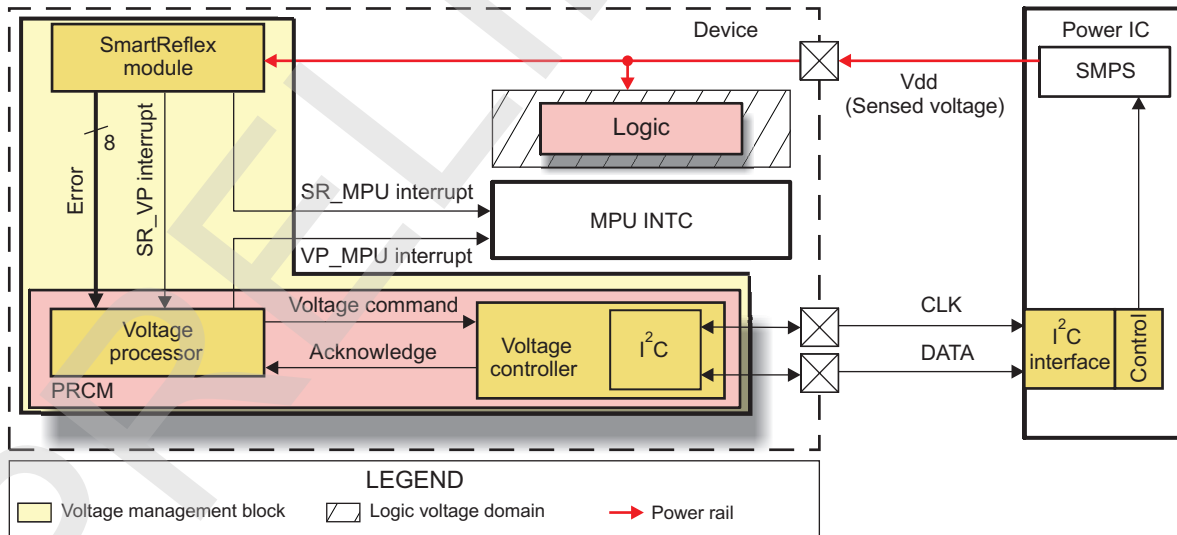

**Figure 3-13. SmartReflex Static Voltage Adjustment**

prcm-013

The dynamic correction of the device voltage is based on the real-time comparison of predefined performance points to the on-chip measured performance level. The device voltage level is raised or lowered to compensate for temperature-induced performance variations.

Without SmartReflex, the voltage variation is around the nominal voltage level and not controlled through any active dynamic compensation. This leads to power waste.

Figure 3-14 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

**Figure 3-14. SmartReflex Voltage Control Functional Overview**

prcm-015

SmartReflex voltage control consists of the following modules:

- SmartReflex
- MPU INTC
- Voltage processor
- Voltage controller
- I<sup>2</sup>C interface

- SMPS

The SmartReflex module senses input voltage (V<sub>dd</sub>) and generates an error value that identifies the difference between the desired optimal voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I<sup>2</sup>C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports two operational modes for SmartReflex voltage control:

- Class-2 or software-controlled
- Class-3 or hardware-controlled

### 3.1.1.3.3.1 Class-2 SmartReflex Voltage Control

In software voltage control, the SmartReflex module interrupts the MPU when the voltage level crosses the defined voltage limits (minimum/maximum). The MPU reads the error value and determines the new voltage command to be sent to the SMPS to return the voltage to within the limits. The new voltage command is sent to the voltage controller, which passes the command to the SMPS and acknowledges its reception.

In class-2 control, the voltage processor is bypassed.

### 3.1.1.3.3.2 Class-3 SmartReflex Voltage Control

In hardware voltage control, the SmartReflex module interrupts the voltage processor when the voltage level crosses the defined voltage limits (minimum/maximum). The voltage processor reads the error value and determines the new voltage command to be sent to the SMPS to return the voltage to within the limits. The new voltage command is sent to the voltage controller, which passes the command to the SMPS and acknowledges its reception.

In class-3 mode, the software does not intervene in voltage control; the entire loop is handled by the hardware modules.

## 3.1.2 Power-Management Techniques

The following sections describe the state-of-the-art power-management techniques supported by the device.

---

**NOTE:** The values in [Figure 3-15](#) through [Figure 3-17](#), which show power-management techniques, are hypothetical. They do not represent valid test results on the device.

---

### 3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

### 3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

**NOTE:** The values in [Figure 3-15](#) are hypothetical. They are meant to clarify the concept only and do not represent valid test results on the device.

**Figure 3-15. Comparison of Energy Consumed With/Without DVFS**

[Figure 3-15](#) shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumptions are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to device making (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

### 3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique aimed at reducing active power consumption of a device. However, whereas DVFS reduces the dynamic and leakage power consumptions, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes

during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode, for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

**NOTE:** The values in Figure 3-16 are hypothetical. They are meant to clarify the concept only and do not represent valid test results on the device.

**Figure 3-16. Comparison of Energy Consumed With/Without DPS**

prcm-017

Figure 3-16 compares the behavior of power consumption for the same device operation without DPS (left side of the figure) and with DPS (right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to zero. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-16). This results in additional dynamic power consumption, referred to as the transition overhead (see Figure 3-16). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, however, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power-saving.

### 3.1.2.4 Adaptive Voltage Scaling

SmartReflex-based AVS is a power-management technique for automatic control of the operating voltages of the device to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage.

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With AVS, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

### 3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for two situations:

- Forward body-bias (FBB) for operating clock frequency boost for operation at higher OPPs.
- Reverse body-bias (RBB) for leakage current reduction for operation at lowest OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the efuse at the device characterization and is not continuously updated. A dedicated LDO, that is, VBBLDO, is used to produce the voltage bias.

### 3.1.2.6 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS can be used at boot time to adapt the voltage to device process characteristics (strong/weak) and then used continuously to compensate temperature variations. AVS can also ensure maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

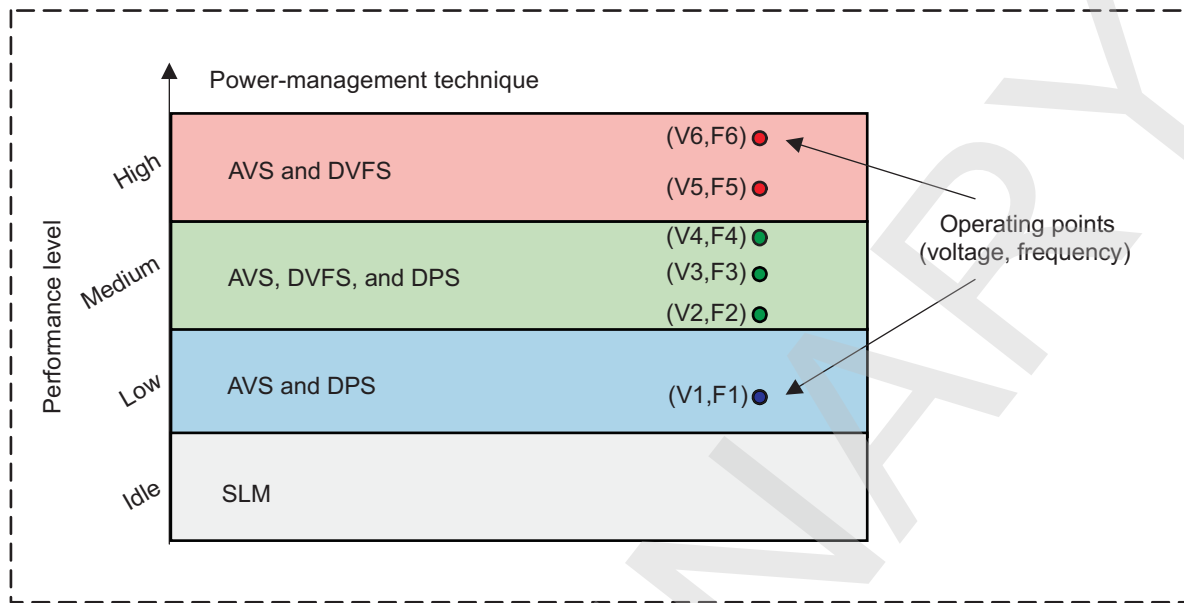

SLM must be used when no applications are running and performance requirement drops to zero.

---

**NOTE:** The OPPs shown in [Figure 3-17](#) are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

---

Figure 3-17. Performance Level and Applied Power-Management Techniques

prcm-018

### 3.1.2.6.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10  $\mu$ s and 100  $\mu$ s) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1 ms to 10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

## 3.2 PRCM Subsystem Overview

### 3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is split over following modules:

- SCRM: Handles system-level (with one or more devices) clock and reset distribution and management.
- PRCM: A logical module composed of following three physical submodules:
  - PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
  - CM1: Handles device-level clock management 1. This module remains always on unless either the device is switched to off mode or no power is supplied to the device pads.
  - CM2: Handles device-level clock management 2. This module does not remain always on. It is switched to full-retention mode when its power domain (PD\_CORE) is in RETENTION state. It is off when either the device is switched to off mode or no power is supplied to the device pads.
- SR\_MPU, SR\_IVA, and SR\_CORE (SmartReflex): Handle AVS features

Together, these modules provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain on/off states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals
- AVS support for the processor and peripherals, for real-time performance adjustments
- Support for low-power device off mode input/output (I/O) pad configuration for minimum power consumption when in OFF power state

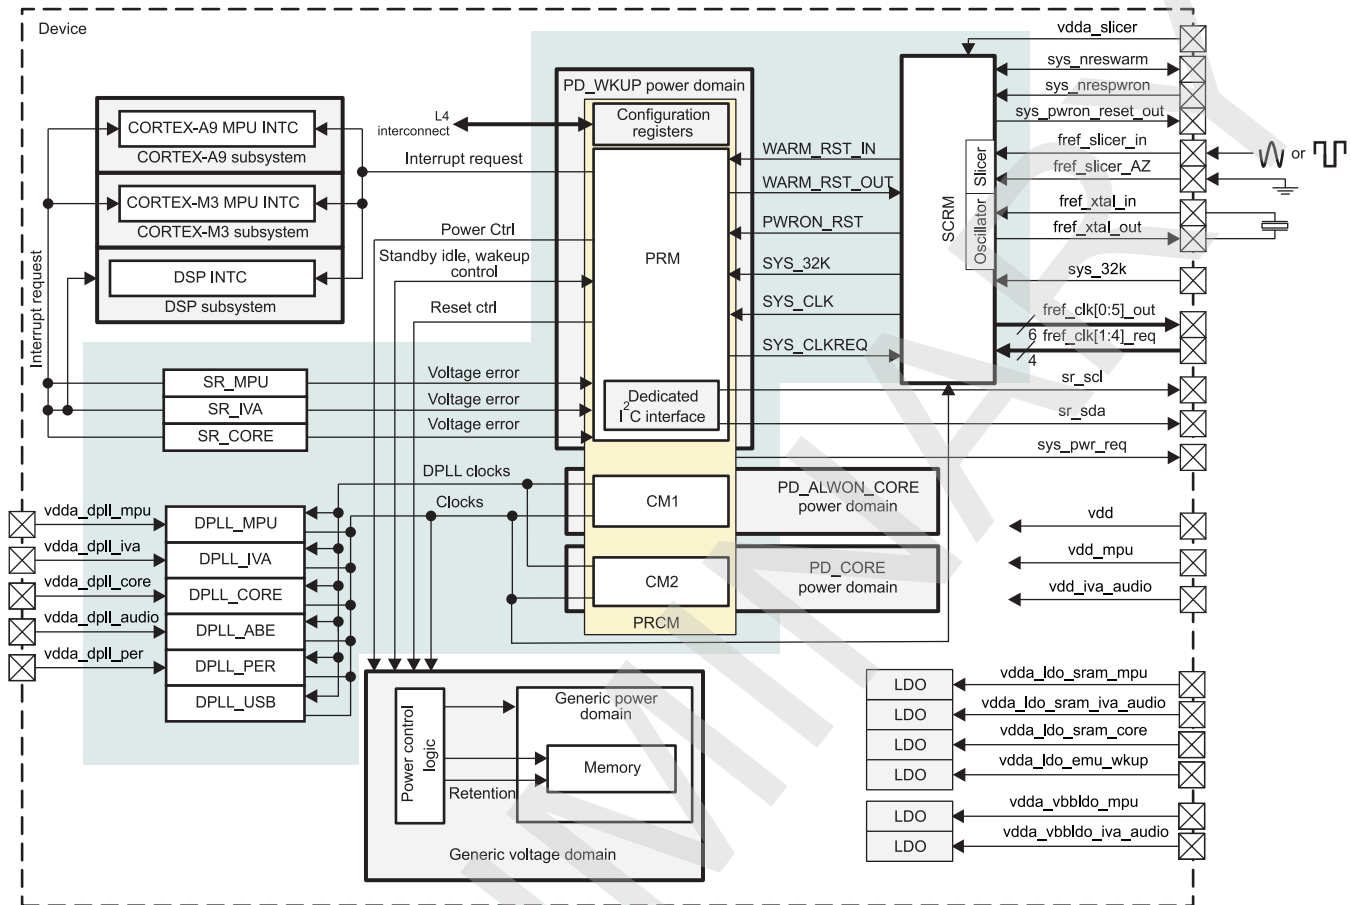

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their level 4 (L4) interface ports.

[Figure 3-18](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-18. PMFW Overview

prcm-019

### 3.2.2 Power-Management Framework Features

The power-management modules have the following features:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Debug and emulation features
- Allow adaptive and dynamic voltage scaling feature through dedicated high-speed (HS) master I<sup>2</sup>C interface
- Control of RFF of device modules to support DPS

### 3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See [Figure 3-18](#).

**NOTE:** In the remainder of this chapter, power IC refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

#### 3.3.1 External Clock Signals

The SCRM module receives a low-frequency clock input, sys\_32k, at 32-kHz frequency. It can receive high-frequency system clock through two possible inputs: fref\_slicer\_in or fref\_xtal\_in. The fref\_slicer\_in supplies the input clock to an on-chip slicer, while fref\_xtal\_in can be used as external crystal connection for internal high-frequency clock generation through an on-chip oscillator.

The SCRM can output six alternate clocks, fref\_clk[0:5]\_out. Output clocks 1 to 4 can be gated or enabled through associated clock request signals, fref\_clk[1:4]\_req.

[Table 3-21](#) lists the external clock pins, signal names, their direction, associated modules, description and reset values of the signals. If the signal is input to the device, then the module is the destination module for the signal; if the signal is an output from the device then the module is the source module of the signal.

**Table 3-21. External Clock Signals**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description	Module Reset Value
sys_32k	SYS_32K	I	SCRM	32-kHz clock input	Z
fref_clk_ioreq	SYSClk_REQ	I/O	SCRM	System clock request. Input when pins sysboot6=0 and sysboot7=0. Otherwise output.	
fref_slicer_in	SLICER_IN	I	SCRM	System clock input to the slicer. It can be sinusoidal or square input signal. Otherwise, it may serve as alternate clock input to internal peripheral (for example, Video DAC).	Z
fref_slicer_AZ	SLICER_AZ	I	SCRM	Connected to ground at package level	Z
fref_xtal_in	XTAL_IN	I/O	SCRM	Oscillator drive input from crystal or alternate square clock input	Unknown
fref_xtal_out	XTAL_OUT	O	SCRM	Oscillator drive output to crystal	Unknown
fref_clk[1:4]_req	CLK[1:4]_REQ	I	SCRM	Auxillary clocks request	Z
fref_clk[0:5]_out	CLK[0:5]_OUT	O	SCRM	Auxillary clocks outputs 0 to 5	0

(1) I = Input; O = Output; I/O = Input and Output (bidirectional)

The auxillary clocks are controlled by the configuration of the SCRM.AUXCLK<clock id> (where clock id can be 0 to 5). It controls the following features:

- Select the clock off output polarity
- Source clock input:
  - System clock
  - Clock from DPLL\_CORE
  - Clock from DPLL\_PER
- Initiate software generated request
- Software-controlled clock gating
- Divide factor configuration between 1 and 16

The bidirectional fref\_clk\_ioreq pad can be used to manage the external system clock request and auxiliary clock request 0. With this implementation, it is not expected to externally drive the system clock request when the SOC is clock requester. This implementation requires programming the SCRM accordingly in case the SOC needs the external system clock request. The programming consists in setting `AUXCLK0[9] DISABLECLK = 1` and `AUXCLKREQ0[4:2] MAPPING = 0`. Without these settings the SCRM would wrongly interpret an external clock request as an auxiliary clock request #0.

### 3.3.2 External Reset Signals

The SCRM manages three reset signals:

- power-on reset input on sys\_nrespwron pin
- power-on reset output on sys\_pwron\_reset\_out pin
- warm reset on sys\_nreswarm pin

sys\_nrespwron is asserted at device power up to reset the full logic in the device. The SCRM asserts the sys\_pwron\_reset\_out signal to reset any associated external peripherals.

sys\_nreswarm is a bidirectional pin. It can be activated at any time by an external device or an external reset push button action to cause a global warm reset event. The SCRM then holds sys\_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys\_reswarm and sys\_nrespwron signals are active low. The sys\_pwron\_reset\_out signal is also active low, and active means that the peripheral is under reset.

Table 3-22 lists the external reset pins, signal names, their direction, associated modules, description and reset values of the signals. If the signal is input to the device, then the module is the destination module for the signal; if the signal is an output from the device, then the module is the source module of the signal.

**Table 3-22. External Reset Signals**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description	Module Reset Value
sys_nreswarm	SYS_WARM_RST	I/O	SCRM	Warm reset input and output	Z
sys_nrespwron	SYS_PWRON_RST_IN	I	SCRM	Power-on reset input	Z
sys_pwron_reset_out	SYS_PWRON_RST_OUT	O	SCRM	Power-on reset to external peripherals	0

(1) I = Input; O = Output

### 3.3.3 External Power Control Signals

The power control signals let the PMFW modules control the device voltage levels.

The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through a PRCM module dedicated I<sup>2</sup>C interface. The sr\_scl and sr\_sda are the clock and data pins, respectively, for this I<sup>2</sup>C interface.

The PRCM module can also command the external power IC to switch the device voltages to off level when the device is in off mode and reactivate them when it wakes up. This is managed through the signal on the sys\_pwr\_req pin.

Table 3-23 lists the signals, I/Os, and module reset values for the signals to the external power IC.

**Table 3-23. Power Control Interface**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description	Module Reset Value
sr_scl	SR_SCL	I/O	PRM	The SmartReflex dedicated I <sup>2</sup> C interface clock line	1
sr_sda	SR_SDA	I/O	PRM	The SmartReflex dedicated I <sup>2</sup> C interface data line	1
sys_pwr_req	PWR_REQ	O	PRM	Power request to external power IC, to exit device off mode.	Unknown

(1) I = Input; O = Output

### 3.3.4 External Voltage Inputs

Table 3-24 lists the external voltage sources related to the PRCM module.

**NOTE:** Table 3-24 highlights only the voltage sources that are either directly managed by the PRCM module or are received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

**Table 3-24. Voltage Sources**

Pin	Signal	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS and DVFS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS and DVFS)	Supplies VDD_MPU_L logic voltage domain
vdd_iva_audio	VDD_IVA_L	Yes (AVS and DVFS)	Supplies VDD_IVA_L logic voltage domain (that is, DSP and IVAHD)
vdda_dpll_core	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE analog power supply
vdda_dpll_mpu	VDDA_DPLL_MPU	No (fixed)	DPLL_MPU analog power supply
vdda_dpll_iva	VDDA_DPLL_IVA	No (fixed)	DPLL_IVA analog power supply
vdda_dpll_per	VDDA_DPLL_PER	No (fixed)	DPLL_PER analog power supply
vdda_dpll_audio	VDDA_DPLL_AUDIO	No (fixed)	DPLL_AUDIO analog power supply
vdda_slicer	VDDA_SLICER	No (fixed)	Clock slicer power supply
vdd_osc	VDD_OSC	No (fixed)	Clock oscillator core power supply
vdda_ldo_sram_mpu	VDDA_LDO_SRAM_MPU	No	Supplies LDO_MPU_M for MPU Cortex-A9 SRAM
vdda_ldo_sram_iva_audio	VDDA_LDO_SRAM_IVA_AUDIO	No	Supplies LDO_IVA_M for IVA SRAM
vdda_ldo_sram_core	VDDA_LDO_SRAM_CORE	No	Supplies LDO_CORE_M for CORE SRAM
vdda_ldo_emu_wkup	VDDA_LDO_EMU_WKUP	No	Supplies LDO_WAKEUP for WAKEUP/EMU logic
vdda_bdgp	VDDA_BDGP	No (fixed)	Bandgap supply input
vdda_vbldo_mpu	VDDA_VBBLDO_MPU	No	MPU VBB LDO supply input
vdda_vbldo_iva_audio	VDDA_VBBLDO_IVA	No	IVA VBB LDO supply input

### 3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective WKUP\_L4 interconnect. In addition to the L4 interconnect, the internal modules interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU Cortex-A9, MPU Cortex-M3, and DSP INTCs
- Voltage error commands from the SmartReflex modules to the external power IC
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-18 shows details of the control interface to a generic power domain.

#### 3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domain, and clock domains. Table 3-25 lists the device-level view with modules association to clock domains, power domains, and voltage domains.

**Table 3-25. PMFW Device-Level Layout**

Voltage Domain	Power Domain	Clock Domain	Module	
LDO_WAKEUP	PD_EMU	CD_EMU	DEBUG

### 3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

#### 3.4.2.1 Power Domain

Table 3-26 lists the PMFW modules and their associated power domains.

**Table 3-26. PMFW Module Power Domains**

PMFW Module	Power Domain
SCRM	PD_WKUP
PRM	PD_WKUP
CM1	PD_ALWON_CORE
CM2	PD_CORE
SR_MPU	PD_ALWON_CORE
SR_IVA	PD_ALWON_CORE
SR_CORE	PD_ALWON_CORE

The PRM part of the PRCM module is in the PD\_WKUP power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM1 part of the PRCM module is in the PD\_ALWON\_CORE power domain, which is an always-on power domain, while the CM2 part of the PRCM module is in the PD\_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

### 3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see [Table 3-27](#)).

**Table 3-27. PMFW Module Reset Signals**

PMFW Module	Reset Signal
SCRM	SYS_PWRON_RST_IN
PRM	SYS_PWRON_RST_IN
CM1	ALWON_CM1_PWRON_RST ALWON_CM1_RST
CM2	CM2_PWRON_RET_RST CM2_RET_RST
SR_MPU	ALWON_CORE_RST
SR_IVA	ALWON_CORE_RST
SR_CORE	ALWON_CORE_RST

**NOTE:** See [Section 3.5.3, Reset Sources](#) for details on the reset trigger sources and assertion conditions.

### 3.4.2.3 Interrupt Requests

The PMFW modules can generate following interrupts listed in [Table 3-28](#).

**Table 3-28. PMFW Module Interrupts**

Source PMFW Module	Source Signal Name	Destination Interrupt Controller	Destination Signal Name
PRCM	PRCM_MPU_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_11
PRCM	PRCM_M3_IRQ	CORTEX-M3_MPU_INTC	MM_IRQ_31
PRCM	PRCM_DSP_IRQ	DSP_INTC	D_IRQ_57
SR_IVA	SR_IVA_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_102
SR_MPU	SR_MPU_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_18
SR_CORE	SR_CORE_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_19

## 3.5 Reset Management Functional Description

### 3.5.1 Overview

In the device the reset scheme is managed by the following modules:

- SCRM: System-level reset management. It provides correct reset routing and sequencing when one or more devices are stacked together in the same package.
- PRM: Device-level reset management

#### 3.5.1.1 SCRM Reset Management Functional Description

The SCRM handles the device power-on and warm reset pads: `sys_nrespwron` and `sys_nreswarm` resets. Its tasks basically consist of:

- Extending reset duration beyond the pad reset release
- Routing the device pad resets to the reset manager in the PRM module

The SCRM is functionally sensitive to the device power-on reset. However, some of the register bits of SCRM registers are reset when a device warm reset occurs.

##### 3.5.1.1.1 Power-On Reset

The SCRM receives the device power-on reset on the `sys_nrespwron` reset pad of the device. It extends the power-on reset duration to the device PRM module at least until a stable 32-kHz clock can be provided to it. The 32-kHz clock version of the device is active once the SCRM releases the internal power-on reset. The SCRM automatically deasserts the reset.

The SCRM automatically requests the system clock under a power-on reset condition. This mechanism is functionally active on the 32-kHz clock.

The power-on reset can also be asserted through software control. Software must enable the software reset assertion feature by setting the `SCRM.EXTPWRONRSTCTRL[0]` ENABLE bit and then by setting the `SCRM.EXTPWRONRSTCTRL[1]` PWRONRST bit to assert the reset.

##### 3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source through warm reset pad `sys_nreswarm` or from the device PRM module as a result of internal event.

The SCRM extends the device pad warm reset duration to the device PRM module.

The SCRM routes a warm reset source (that is, `sys_nreswarm` pad/PRM module) to a warm reset destination (that is, PRM module).

This routing of reset from the device pad to the PRM is enabled and disabled using the `SCRM.EXTWARMRSTCTRL` register. It is enabled by default.

The source of a warm reset, for each destination is logged in the corresponding `SCRM.EXTWARMRSTST_REG` register. The status of the reset source is logged when the destination reset is released. This is done at 32-kHz clock.

Software must clear the reset status bit.

#### 3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

---

**NOTE:** The PRM module has no knowledge or control over resets generated locally within a module (for example, through configuration register bit `<Module name>_SYSCONFIG[x] SOFTRESET`). Software reset has the same effect on the module logic as a hardware reset.

---

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS\_CLK clock. The reset managers in PRM use this clock for internal stall (delay) counter to delay deassertion of reset when the input reset source is deasserted.

In each power domain, one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

---

**NOTE:** All internal reset signals are active low, except for the DPLL reset signals, which are active high.

---

### 3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software or hardware triggered reset
- Retention type: Retention reset or nonretention reset

#### 3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected (the eFuse bad device is detected, etc.).
- Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

#### 3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial power-on reset.
- Warm reset: Occurs when the device is in normal operating state. A module may use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON\_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM
- All eFuses
- EMIF
- Control module – All the module instances in the PD\_WKUP power domain

---

**NOTE:** For information about the PRCM module registers affected by the global warm reset, see the register description in [Section 3.11, PRCM Register Manual](#).

---

#### 3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

### 3.5.2.4 Retention Type

The Power Domain Manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>\_DOM\_RET\_RST and <PowerDomain>\_DOM\_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support two retention mechanisms: CSWRET and OSWRET. Nonretention type reset source has following behavior:
  - It is asserted in-case of power domain state transition from OSWR-RETENTION state.
  - It is not asserted in-case of power domain state transition from CSWR-RETENTION state.

## 3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are listed in this section.

### 3.5.3.1 Global Reset Sources

Table 3-29 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

**Table 3-29. Global Reset Sources**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	SYS_PWRON_RST	Received from SCRM through input pin or through software control	The entire device is reset on power up.
H/C	BAD_DEVICE_RST	PRCM	Asserted when during the power-up sequence the device is identified as bad, after reading eFuses
H/W	SYS_WARMIN_RST	Received from SCRM through input pin or through software control	External hardware warm reset
S/C	GLOBAL_COLD_SW_RST	PRCM module.PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRCM module.PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	VDD_CORE_VOLT_MGR_RST	PRCM	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode
H/W	VDD_IVA_VOLT_MGR_RST	PRCM	
H/W	VDD_MPU_VOLT_MGR_RST	PRCM	
H/W	ICEPICK_RST	ICEPick module	It is used in emulation mode only.
H/W	ICEPICKPOR_RST	ICEPick module	It is used in emulation mode only.
H/W	CORTEXA9_WDT_RST	Either WDTIMER2 or MPU_A9 subsystem	It is triggered by a time-out event.
H/W	C2C_WARM_RST	C2C module	Global hardware warm reset.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

### 3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software or hardware

triggered. [Table 3-30](#) identifies the possible types of hardware-triggered local cold reset sources. Some power domains may support one or both of these local cold reset sources. The table does not highlight the software-triggered local warm reset sources which are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

**Table 3-30. Local Reset Sources**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain transition from OFF or OSWR-RETENTION state to ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

### 3.5.4 Reset Domains

A power domain may receive power-on reset (PWRON\_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON\_RST are asserted.
- On any global or local warm reset, only RST is asserted.

A power domain may receive two additional retention logic reset signals: power-on retention reset (PWRON\_RET\_RST) and/or retention reset (RET\_RST). These signals behave as follows:

- On any global cold reset or wakeup from OFF state to ON-ACTIVE state, RET\_RST and PWRON\_RET\_RST are asserted.
- On any global warm reset, only RET\_RST is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

This section presents the trigger sources and attributes for all reset domains of the device. See [Section 3.5.3, Reset Sources](#), for an explanation on each reset trigger source of the device.

[Table 3-31](#) identifies the associated power and reset domains for each module.

Table 3-33 lists the attributes of the reset manager associated with the reset domains. The clock to the reset manager, the delay count before release of reset, and the reset release stall conditions for the reset domains are listed. Apart from the identified reset release stall conditions, a universal release stall condition (that is, applicable to all reset signals) is the eFuse scan completion.

**Table 3-33. Reset Domains Attributes**

DSP_RET_RST	SYS_CLK	ResetTime2 <sup>(1)</sup>	DSP_ROOT_CLK clock is not active and subsystem is reset.
DSP_SYS_RST	SYS_CLK	ResetTime2 <sup>(1)</sup>	DSP_ROOT_CLK clock is not active and subsystem is reset.
WKUP_PWRON_RST	SYS_CLK	0x0	None
WKUP_RST	SYS_CLK	0x0	None
WKUP_SYS_PWRON_RST	None	N/A	None

(1) ResetTime2 is set in the [PRM\\_RSTTIME\[14:10\]](#) RSTTIME2 bit field.

**NOTE:** WKUP\_SYS\_PWRON\_RST is directly connected to SYS\_PWRON\_RST source reset.

### 3.5.5 Reset Logging

A reset of the device is logged in two ways. First, dedicated registers in the PRM module (the [RM\\_<Power domain>\\_RSTST](#)) log the reset sources to power domain. Second, the Control Module logs the device reset activity in dedicated registers.

### 3.5.5.1 PRCM Module Reset Logging Mechanism

The reset status registers RM\_<power domain>\_RSTST and RM\_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the RM\_<Power domain>\_RSTST[0] GLOBALCOLD\_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset was asserted and then released, but a global cold reset source was asserted before the release of the domain reset signal.

### 3.5.6 Reset Sequences

#### 3.5.6.1 SCRM Power-on Reset Sequence

Figure 3-19 shows the power-on reset sequence as the reset is received by the SCRM and resulting interaction between SCRM and PRCM modules. Figure 3-20 shows the power-on reset sequence within the PRCM module.

Figure 3-19. SCRM Power-On Reset Sequence

1. The power-on reset pad is released from reset while the 32 kHz is already active.
2. SCRM releases its internal power-on reset clocked at the 32-kHz clock.
3. SCRM delays the release of PRCM module resets to account for the stabilization time of the system clock source. It routes the 32-kHz clock to the PRCM module.

4. SCRM releases from reset (both power-on and warm reset) the PRCM module.
5. The PRCM module asserts a system clock request to the SCRM.
6. Once the system clock setup time counter overflows, the internal system clock version of SCRM is stable.
7. SCRM ungates the system clock to the PRCM module.

### 3.5.6.2 PRCM Module Power-On Reset Sequence

Figure 3-20 shows the power-on reset sequence.

**Figure 3-20. PRCM Module Power-On Reset Sequence**

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.

- The SCRM module is supplying the 32-kHz clock to the PRCM module and the clock is stable.
- The power-on reset SYS\_PWRON\_RST\_IN has been released by the external power IC.

The power-up sequence is:

1. The SCRM releases global power-on reset to the PRCM module (that is, PRCM\_SYS\_PWRON\_RST). As a result, the PRCM module starts the power-on reset sequence.
2. The PRCM module releases the SYS\_NRES\_WARM\_OUT to the SCRM (only after all voltage domains have ramped-up) after some 32-kHz clock cycles, and it also asserts the APE\_PRCM\_SYS\_CLKREQ to the SCRM module to request the system clock.
3. SCRM provides the system clock to the PRCM module when the system clock source is stable.
4. Once the Standard eFuse controller clock has been enabled by the PRCM module, the PRM releases the standard eFuse controller domain from reset. This starts the eFuse sensing sequence. Upon completion of the eFuse auto load sequence, the PRM turns off the Standard eFuse controller clock. It also powers down the standard efuse controller power domain PD\_STD\_EFUSE.
5. The PRM logic is then released from reset. The PRM provides the CM1 with a version of the system clock and releases the CM1 from reset.
6. The CM1 starts the reference clock (and also bypass clock) of the CORE DPLL. In turn, the CORE DPLL, which is configured in bypass mode, generates the L3 clock (running at the system clock frequency at this stage). Now the CM1 logic is fully operational: CM1 logic is released from reset and L3 clock is running.
7. The CM1 starts the L4 clock version for the CM2 and the PRM deasserts the reset of the CM2.
8. The DPLLs are released from reset. The DPLLs can be released from reset before the L3 clock is running. The DPLL being under reset does not prevent the output clock from running. The CM1 starts the reference and bypass clocks to the DPLL\_MPU.
9. The CORE is released from reset, provided the L3 clock is running. The EMIF comes out of reset as soon as CORE power domain power on retention reset (CORE\_PWRON\_RET\_RST, see [Table 3-33](#)) is released by the PRCM module. The PRCM module also releases the EMIF\_DDR\_PHY\_PWRON\_RST. The EMIF DDR PHY X2 clock (that is, PHY\_ROOT\_CLK) is not running at this point, hence all the PHYs are asynchronously reset at the same time. The EMIF PHY clock is started later.
10. The PRCM module releases the idle request signal to the EMIF module once the EMIF functional clock is enabled. The EMIF then acknowledges the deassertion of idle request and becomes active.
11. The Cortex-A9 MPU subsystem is released from reset provided its clock is active and the L3 interconnect is operational.

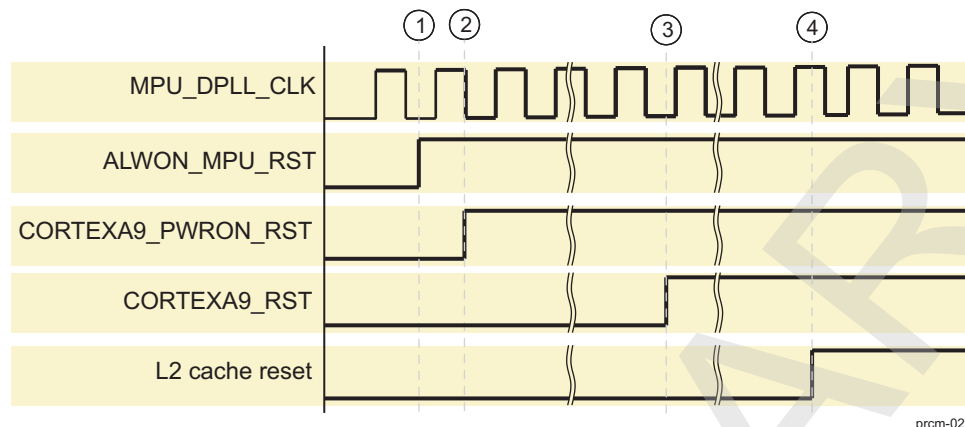

---

**NOTE:**

- PD\_DSP and PD\_IVAHD power domains are held under reset after power up by the assertion of software source of reset.
  - PD\_DSS, PD\_SGX, PD\_AUDIO, and PD\_CAM are held under reset after power up until the PRCM module enables their interface clock.
- 

### 3.5.6.3 Cortex-A9 MPU Subsystem Power-On Reset Sequence

[Figure 3-21](#) shows the power-on reset sequence of the Cortex-A9 MPU subsystem.

**Figure 3-21. Cortex-A9 MPU Power-On Reset Sequence**

prcm-022

The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL\_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL\_MPU reset and the DPLL\_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules inside the Cortex-A9 MPU subsystem.

The power-on reset sequence is:

1. The PRCM module releases asynchronously in PD\_ALWON\_MPU the ALWON\_MPU\_RST reset to the CORTEXA9\_MPU\_INTC module inside the Cortex-A9 MPU subsystem.
2. The PRCM module releases in PD\_MPU the CORTEXA9\_PWRON\_RST (only after the MPU\_DPLL\_CLK is active) to the Cortex-A9 MPU subsystem and waits until the subsystem completes its internal reset sequence.
3. Once the Cortex-A9 MPU subsystem internal reset sequence completes, the PRCM module releases in PD\_MPU the CORTEXA9\_RST signal and the Cortex-A9 MPU starts booting.
4. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU\_DPLL\_CLK cycles after the release of CORTEXA9\_PWRON\_RST and CORTEXA9\_RST.

**NOTE:**

- The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is asserted during initial power-on reset (that is, when the PD\_MPU wakes-up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD\_MPU wakes-up from RETENTION state, that is (when the logic is off and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wake-up.
- The L1 cache memory in the Cortex-A9 MPU subsystem is not retained on PD\_MPU wake-up.

**3.5.6.4 Cortex-A9 MPU Subsystem Warm Reset Sequence**

Figure 3-22 shows the warm reset sequence of the Cortex-A9 MPU subsystem.

**Figure 3-22. Cortex-A9 MPU Warm Reset Sequence**

The assumptions are:

- The DPLL\_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.
- A global or local warm reset to the Cortex-A9 MPU subsystem is asserted.

The warm reset sequence is:

1. The PRCM module asserts in PD\_ALWON\_MPU the ALWON\_MPU\_RST reset to the CORTEXA9\_MPU\_INTC module inside Cortex-A9 MPU subsystem.
2. The PRCM module asserts in PD\_MPU the CORTEXA9\_RST reset to the Cortex-A9 MPU subsystem.
3. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
4. The PRCM module releases the ALWON\_MPU\_RST reset to the CORTEXA9\_MPU\_INTC module.
5. The PRCM module releases the CORTEXA9\_RST, only after the DPLL\_MPU is in bypass mode and MPU\_DPLL\_CLK is stable and active.
6. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU\_DPLL\_CLK cycles after the release of CORTEXA9\_RST.

### 3.5.6.5 Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or Off STATE

Figure 3-22 shows the sleep and wake-up transitions reset sequence from RETENTION or OFF state of the Cortex-A9 MPU subsystem.

**Figure 3-23. Cortex-A9 MPU Reset Sequence on Sleep and Wake-Up Transition**

The assumption is:

- The DPLL\_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.

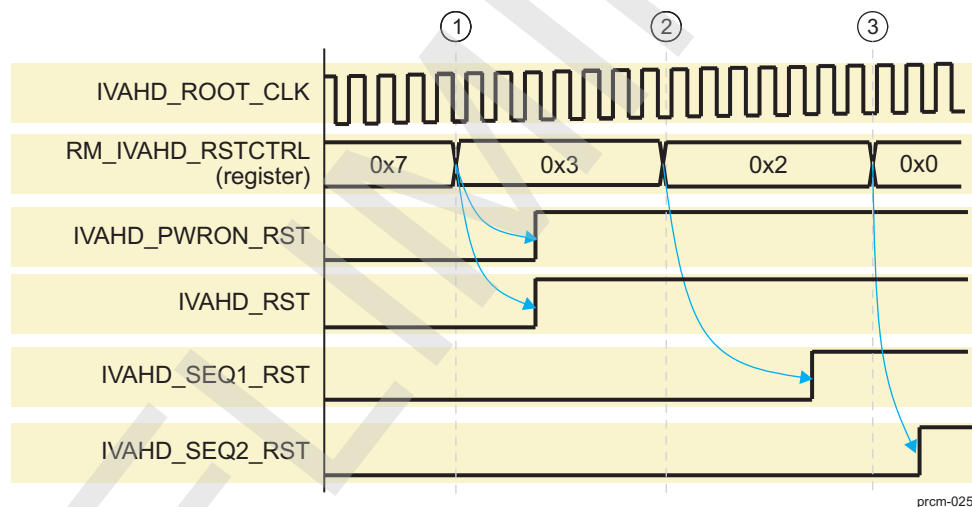

The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates the MPU\_DPLL\_CLK to Cortex-A9 MPU subsystem.
2. The PRCM module switches the PD\_MPU to RETENTION state.
3. The PRCM module asserts CORTEXA9\_PWRON\_RST and CORTEXA9\_RST resets to Cortex-A9 MPU subsystem. The entire logic in the PD\_MPU is held in reset. The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is not asserted if the logic in the PD\_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
5. The PRCM module releases the ALWON\_MPU\_RST reset to the CORTEXA9\_MPU\_INTC module.
6. The PRCM module releases the CORTEXA9\_RST, only after the DPLL\_MPU is in bypass mode and MPU\_DPLL\_CLK is stable and active.
7. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU\_DPLL\_CLK cycles after the release of CORTEXA9\_RST.

### 3.5.6.6 IVAHD Subsystem Power-On Reset Sequence

Figure 3-24 shows the power-on reset sequence of the IVAHD subsystem.

**Figure 3-24. IVAHD Power-On Reset Sequence**

The power-on reset to IVAHD is applied when PD\_IVAHD is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the functional clock IVAHD\_ROOT\_CLK to the IVAHD subsystem and it has been enabled by the software control.

The power-on reset sequence is:

1. Software clears the [RM\\_IVAHD\\_RSTCTRL\[2\]](#) RST3 bit. This causes the PRCM module to release the IVAHD\_PWRON\_RST reset used inside IVAHD to reset mainly the emulation logic and the IVAHD\_RST reset used to reset all logic inside IVAHD. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. Software clears the [RM\\_IVAHD\\_RSTCTRL\[0\]](#) RST1 bit. This releases the IVAHD\_SEQ1\_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the [RM\\_IVAHD\\_RSTCTRL\[1\]](#) RST2 bit. This releases the IVAHD\_SEQ2\_RST reset to the Sequencer2 CPU.

### 3.5.6.7 IVAHD Subsystem Software Warm Reset Sequence

Figure 3-25 shows the software warm reset sequence of the IVAHD Subsystem.

Figure 3-25. IVAHD Software Warm Reset Sequence

Before asserting the software reset to the IVAHD subsystem the MPU software must ensure that:

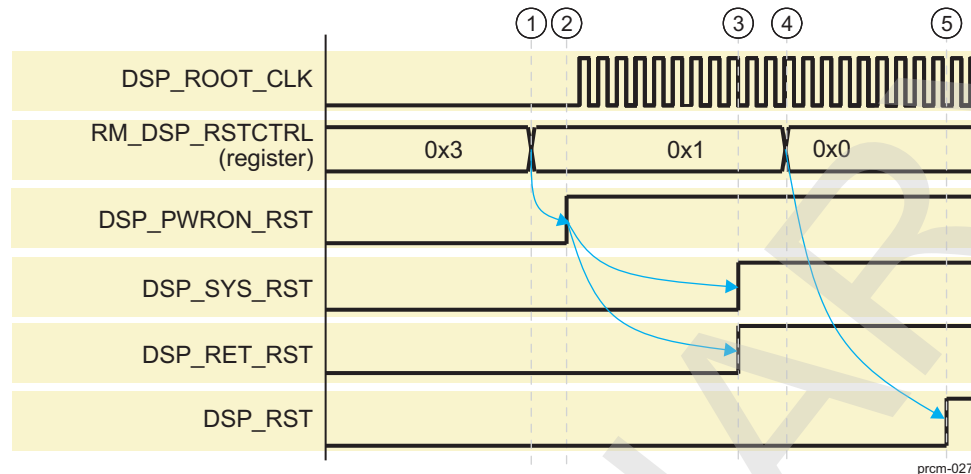

- IVAHD sequencer CPUs are in IDLE state ([CM\\_IVAHD\\_IVAHD\\_CLKCTRL\[17:16\]](#) IDLEST).
- The IVA HD subsystem is in STANDBY state ([CM\\_IVAHD\\_IVAHD\\_CLKCTRL\[18\]](#) STBYST).
- The functional clock to the IVAHD subsystem has been gated by the PRCM module ([CM\\_IVAHD\\_CLKSTCTRL\[8\]](#) CLKACTIVITY\_IVAHD\_CLK).

The software reset sequence is:

1. The MPU software sets the [RM\\_IVAHD\\_RSTCTRL\[2\]](#) RST3, [RM\\_IVAHD\\_RSTCTRL\[1\]](#) RST2, and [RM\\_IVAHD\\_RSTCTRL\[0\]](#) RST1 bits. This causes the PRCM module to assert the IVAHD\_RST, IVAHD\_SEQ1\_RST, and IVAHD\_SEQ2\_RST resets to the IVAHD subsystem. The IVAHD\_PWRON\_RST remains deasserted.
2. The MPU software enables the functional clock to the IVAHD subsystem.
3. The MPU software clears the [RM\\_IVAHD\\_RSTCTRL\[2\]](#) RST3 and [RM\\_IVAHD\\_RSTCTRL\[0\]](#) RST1 bits. This causes the PRCM module to release the IVAHD\_RST and IVAHD\_SEQ1\_RST resets to the IVAHD subsystem.
4. The MPU software clears the [RM\\_IVAHD\\_RSTCTRL\[1\]](#) RST2 bit. This releases the IVAHD\_SEQ2\_RST reset to the Sequencer2 CPU.

### 3.5.6.8 DSP Subsystem Power-On Reset Sequence

Figure 3-26 shows the power-on reset sequence of the DSP subsystem.

**Figure 3-26. DSP Subsystem Power-On Reset Sequence**

The assumptions on power-on reset assertion are:

- The PD\_DSP is on.
- The MPU software sets the [CM\\_DSP\\_DSP\\_CLKCTRL\[1:0\]](#) MODULEMODE bit field to Auto.
- The MPU software sets the [CM\\_DSP\\_CLKSTCTRL\[1:0\]](#) CLKTRCTRL bit field to SW\_WKUP or HW\_AUTO.
- The DPLL\_IVA is active and providing the DSP\_ROOT\_CLK. It can be locked prior to this sequence.

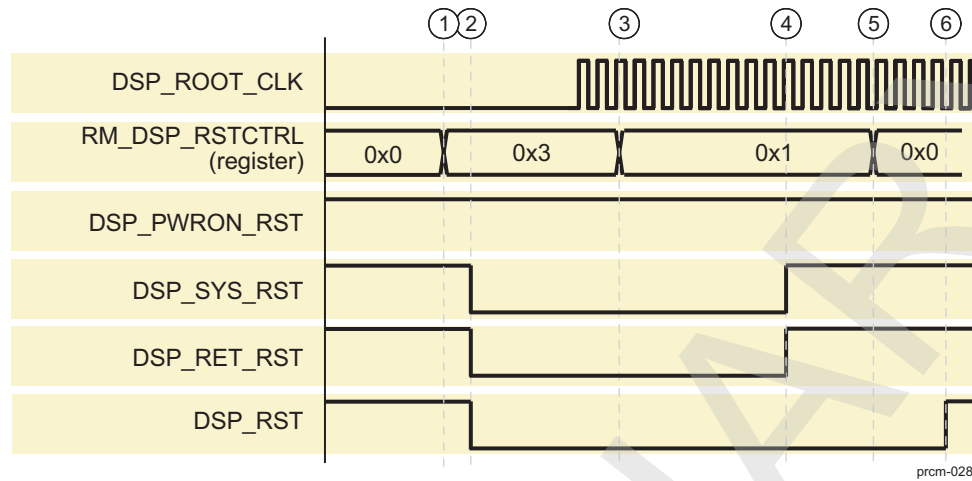

The power-on reset sequence is:

1. The MPU software clears the [RM\\_DSP\\_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register to release from reset the DSP, MMU, and CACHE interface.
2. The PRCM module releases DSP\_PWRON\_RST once the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) has reached its limit. Upon the deassertion of power-on reset signal, the DSP subsystem starts the initialization sequence. During this initialization sequence all the internal registers inside DSP are properly reset and it also completes the reset for DSP, MMU, and CACHE interface.
3. Once the reset sequence of Step 2 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases DSP\_SYS\_RST and DSP\_RET\_RST signals.
4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration is done, the MPU software clears the [RM\\_DSP\\_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
5. The PRCM module releases DSP\_RST, which causes the DSP to start booting.

### 3.5.6.9 DSP Subsystem Software Warm Reset Sequence

[Figure 3-27](#) shows the software warm reset sequence of the DSP subsystem.

**Figure 3-27. DSP Subsystem Software Warm Reset Sequence**

The assumptions on power-on reset assertion are:

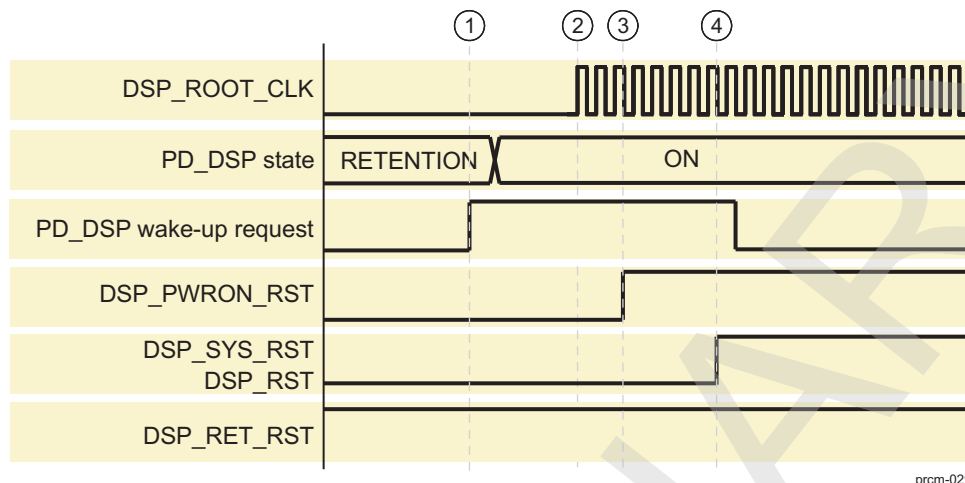

- The DSP is in IDLE state.
- The DSP\_ROOT\_CLK is gated.

The power-on reset sequence is:

1. The MPU software sets the [RM\\_DSP\\_RSTCTRL\[1\]](#) RST2 and [RM\\_DSP\\_RSTCTRL\[0\]](#) RST1 bits.
2. The PRCM module asserts the DSP\_SYS\_RST, DSP\_RET\_RST, and DSP\_RST reset signals. DSP\_PWRON\_RST remains deasserted in this case.
3. The MPU software re-enables the DSP\_ROOT\_CLK and clears the [RM\\_DSP\\_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register to reset DSP, MMU, and CACHE interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. Once the reset sequence of Step 3 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases the DSP\_SYS\_RST and DSP\_RET\_RST signals.
5. The MPU software clears the [RM\\_DSP\\_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
6. The PRCM module releases DSP\_RST, which causes the DSP to start booting.

### 3.5.6.10 DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State

Figure 3-28 shows the reset sequence of the DSP subsystem on wake-up transitions from OSWR RETENTION state.

**Figure 3-28. DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State**

The assumptions on power-on reset assertion are:

- The DSP is in INACTIVE state.
- The DSP\_ROOT\_CLK is gated.
- The PD\_DSP is in OSWR RETENTION state.
- The DSP\_PWRON\_RST, DSP\_SYS\_RST, and DSP\_RST resets are held asserted, while DSP\_RET\_RST is not asserted by the PRCM module.

The power-on reset sequence is:

1. A wake-up request is received by the PRCM module and it switches the PD\_DSP to ON state
2. The PRCM module then enables the DSP\_ROOT\_CLK and switches the CD\_DSP to ACTIVE state.
3. The PRCM module releases DSP\_PWRON\_RST once the reset manager counter ([PRM\\_RSTTIME\[14:10\] RSTTIME2](#)) has reached its limit. Upon the deassertion of the power-on reset signal, the DSP subsystem starts the initialization sequence.
4. Once the reset sequence of Step 3 completes the PRCM module releases the DSP\_SYS\_RST and DSP\_RST signals.

### 3.5.6.11 Cortex-M3 MPU Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the Cortex-M3 MPU subsystem.

**Figure 3-29. Cortex-M3 MPU Power-On Reset Sequence**

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU subsystem is held in reset by the PRCM module and the CORTEXM3\_PWRON\_RST, CORTEXM3\_RET\_RST, CORTEXM3\_RST1, CORTEXM3\_RST2, and CORTEXM3\_RST3 are asserted.

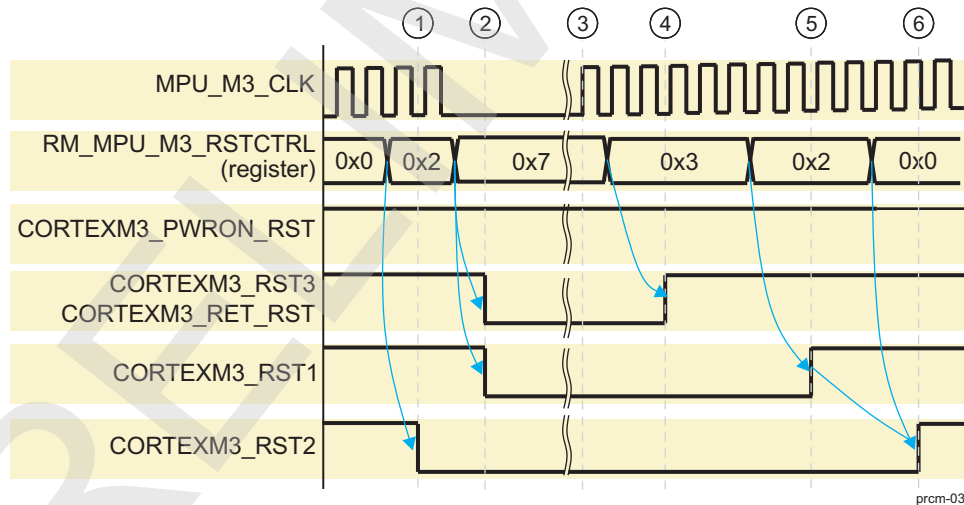

The power-on reset sequence is:

1. Software clears the `RM_MPU_M3_RSTCTRL[2]` RST3 bit in the PRCM module register to release from reset the MPU M3 Cache and MMU.
2. The PRCM module releases `CORTEXM3_PWRON_RST` once the reset manager counter (`PRM_RSTTIME[14:10]` RSTTIME2) has reached its limit and the `MPU_M3_CLK` is running. Upon the deassertion of the power-on reset signal, the Cortex-M3 MPU subsystem starts the CPU and MMU initialization sequence.
3. Once the reset sequence of Step 2 completes and the reset manager counter (`PRM_RSTTIME[14:10]` RSTTIME2) has expired, the PRCM module releases the `CORTEXM3_RST3` and `CORTEXM3_RET_RST` signals.
4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration and cache initialization is done, the MPU software clears the `RM_MPU_M3_RSTCTRL[0]` RST1 bit in the PRCM module register.
5. The PRCM module releases `CORTEXM3_RST1`, which causes the Cortex-M3 MPU Core 1 to start booting.
6. The MPU software can clear the `RM_MPU_M3_RSTCTRL[1]` RST2 bit in the PRCM module register so that the PRCM module releases the `CORTEXM3_RST2` to the Cortex-M3 MPU Core 2.

### 3.5.6.12 Cortex-M3 MPU Subsystem Software Warm Reset Sequence

Figure 3-30 shows the software warm reset sequence of the Cortex-M3 MPU subsystem.

Figure 3-30. Cortex-M3 MPU Subsystem Software Warm Reset Sequence

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU Core 2 is in Idle state.

The power-on reset sequence is:

1. The Cortex-M3 MPU Core 1 software or Cortex-A9 MPU software sets the `RM_MPU_M3_RSTCTRL[1]` RST2 bit. The PRCM module asserts the `CORTEXM3_RST2` reset signal to the Cortex-M3 Core 2.
2. The Cortex-A9 MPU cuts the `MPU_M3_CLK` and software sets the `RM_MPU_M3_RSTCTRL[2]` RST3 and `RM_MPU_M3_RSTCTRL[0]` RST1 bits.
3. The PRCM module asserts the `CORTEXM3_RST3`, `CORTEXM3_RET_RST`, and `CORTEXM3_RST1` reset signals. The `CORTEXM3_PWRON_RST` remains deasserted in this case.
4. The MPU software re-enables the `MPU_M3_CLK` and the initialization sequence starts inside Cortex-M3 subsystem. Software clears the `RM_MPU_M3_RSTCTRL[2]` RST3 bit in the PRCM module

register.

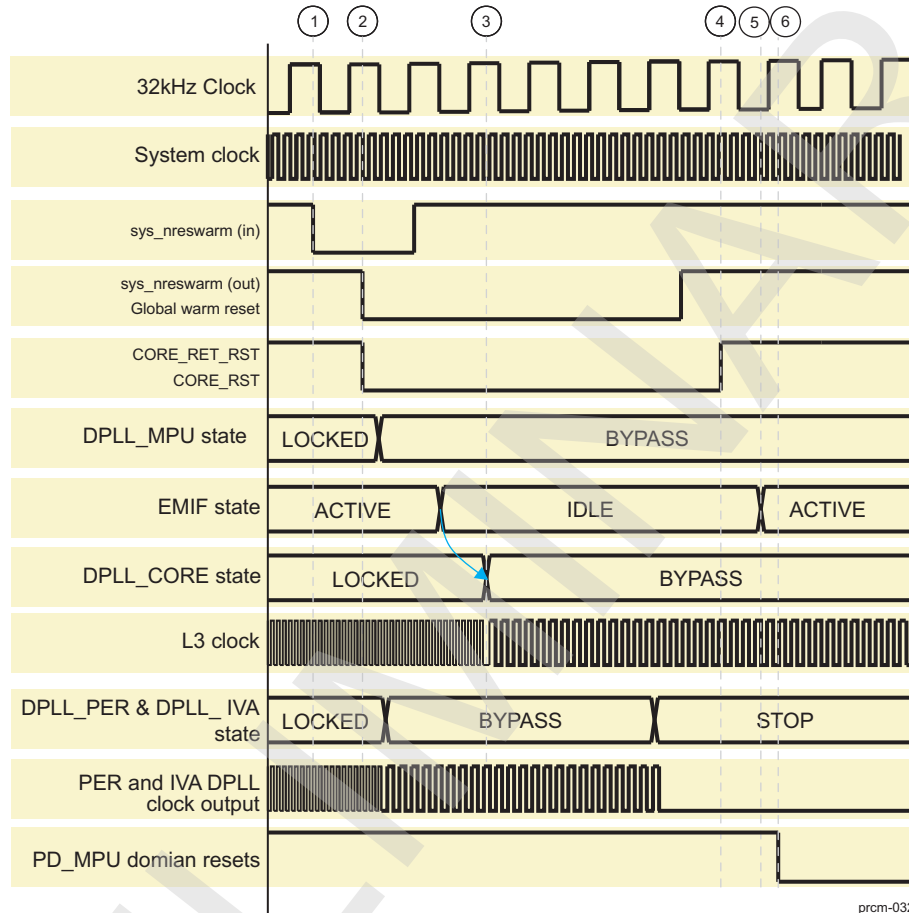

5. Once the reset sequence of Step 4 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases CORTEXM3\_RST3, CORTEXM3\_RET\_RST, and CORTEXM3\_RST1 reset signals. The Cortex-M3 MPU Core 1 starts rebooting.
6. Software can then clear the [RM\\_MPU\\_M3\\_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register.. The PRCM module releases the CORTEXM3\_RST2 reset signal to the Cortex-M3 MPU Core 2 to start booting.

### 3.5.6.13 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-31 shows the global warm reset sequence.

Figure 3-31. Global Warm Reset Sequence

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and DSP DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates IDLE state transition. The PRCM module delays global warm reset to the device for minimum 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM memory to self-refresh mode.
2. The reset managers in PRM assert the following resets:
  - The external warm reset SYS\_WARM\_RST (output) to the SCRM.
  - All power domain warm resets are asserted.
  - DPLL resets are not asserted.
    - DPLL\_MPU transitions to bypass mode.
    - DPLL\_CORE transitions to bypass mode once the EMIF has switched to IDLE state.
    - DPLL\_IVA, DPLL\_PER, and DPLL\_ABE transition to low-power stop mode.
  - The system clock remains active.

- The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
  - CM gates the clocks not needed, as per their default reset setting in the associated registers.
3. After the warm reset source is released, the global warm reset and extended until the following conditions are met:
- Device reset manager counter overflows. It is set up by the `PRM_RSTTIME[9:0]` RSTTIME1 bit field.
  - All logic voltage sources (VDD\_IVA and VDD\_CORE) are stable.

---

**NOTE:** Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

---

4. The CORE power domain is released from reset (that is, warm reset sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF back to ACTIVE state from IDLE state.
6. PD\_MPU is released from reset when the clocks to the Cortex-A9 MPU subsystem are active. The Cortex-A9 MPU reboots.

---

**NOTE:**

- PD\_DSP and PD\_IVAHD power domains are held under reset after global warm reset by assertion of the software source of the reset.
  - PD\_L4\_PER, PD\_L3\_INIT, PD\_DSS, PD\_SGX, and PD\_CAM are held under reset after global warm reset until the PRCM module enables their interface clock.
  - The reset to the standard eFuse power domain, PD\_STD\_EFUSE, is not asserted on a global warm reset.
-

## 3.6 Clock Management Functional Description

### 3.6.1 Overview

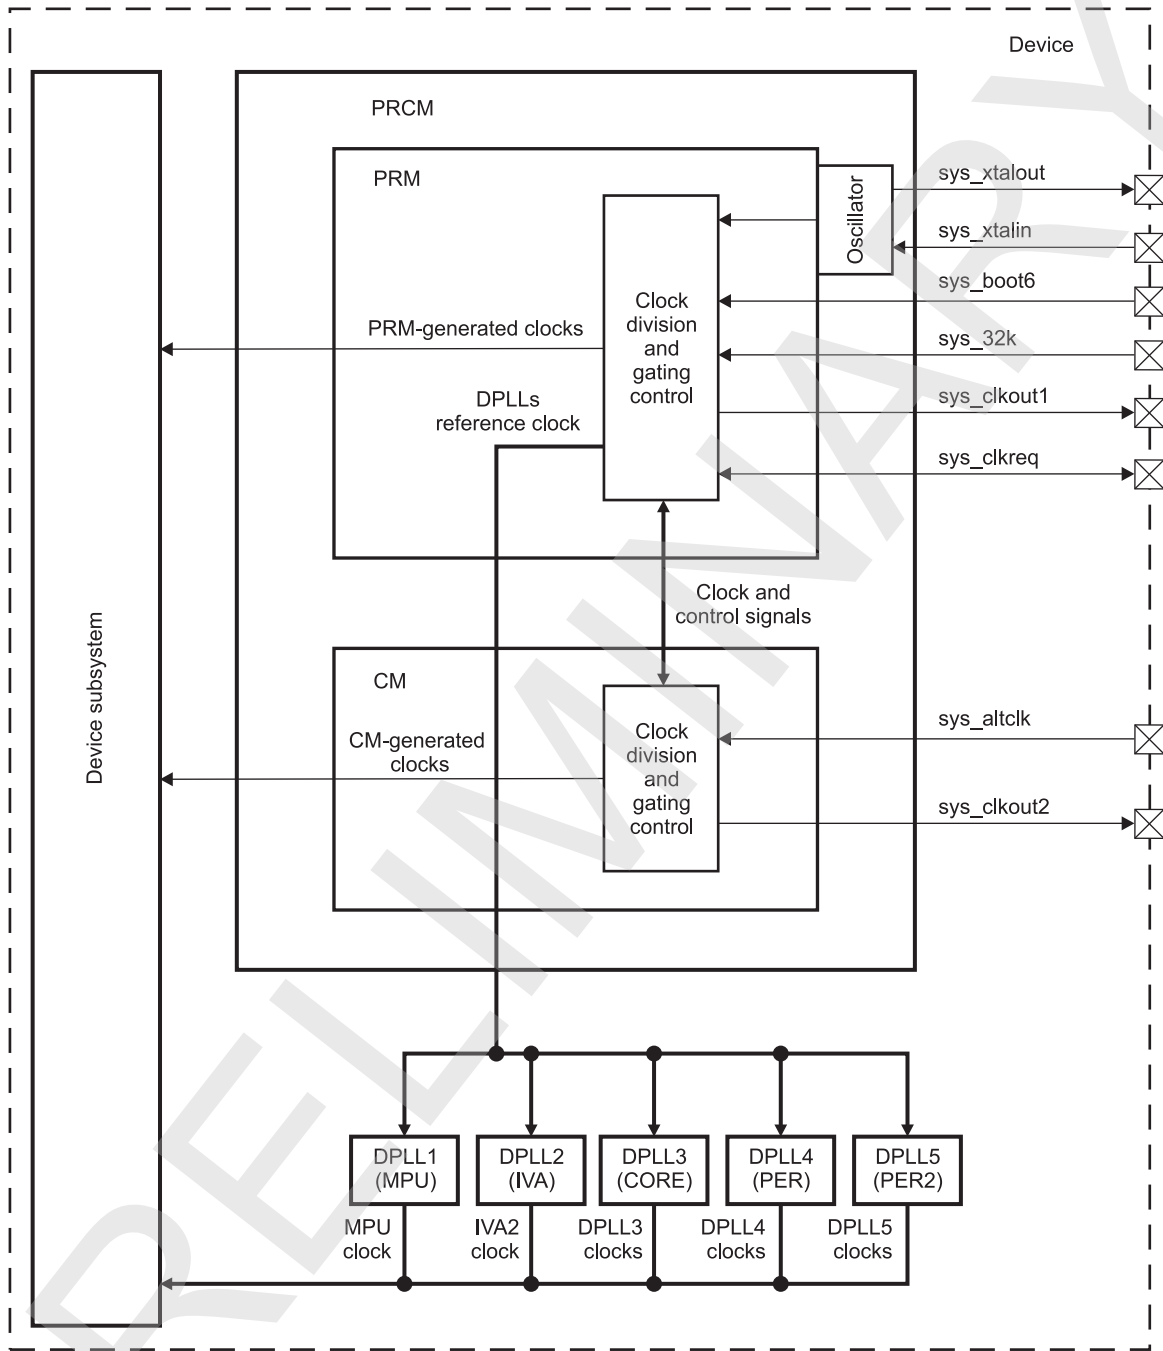

The PRCM module provides control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. See [Section 3.1.1.1, \*Clock Management\*](#), for information on the clock-management functional architecture of the device.

The high-frequency system clock is received by the device from an external source or generated within the device (internal oscillator) by the SCRM. The SCRM also receives the 32-kHz low-frequency clock from the external source.

The stable versions of the system and 32-kHz clock are provided by the SCRM to the PRCM module. The PRCM module provides clocks to the internal DPLLs for internal high-frequency clocks generation. Clock division and gating are handled by the PRM, the CM1 and CM2 sections of the PRCM module.

[Figure 3-32](#) shows the high-level clock-management scheme in the device.

Figure 3-32. PRCM Module Clock Manager Overview

prcm-078

### **3.6.2 External Clock Inputs**

#### **3.6.2.1 sys\_32k Clock Input**

The 32-kHz frequency is used for low-frequency operation (timer, debouncing, etc.). It supplies the wake-up domain for operation in lowest power mode and as clock source to the DPLL\_ABE module (for audio back-end [ABE]).

#### **3.6.2.2 High-Frequency System Clock Input**

The system clock, SYS\_CLK, is the main source clock of the device. SYS\_CLK is received directly from the SCRM by the PRM subsection of the PRCM module. It is supplied as the reference clock to the DPLLs as well as functional clock to several modules.

### **3.6.3 Internal Clock Sources/Generators**

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives the 32-kHz and system clocks from SCRM
- CM1 and CM2 clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

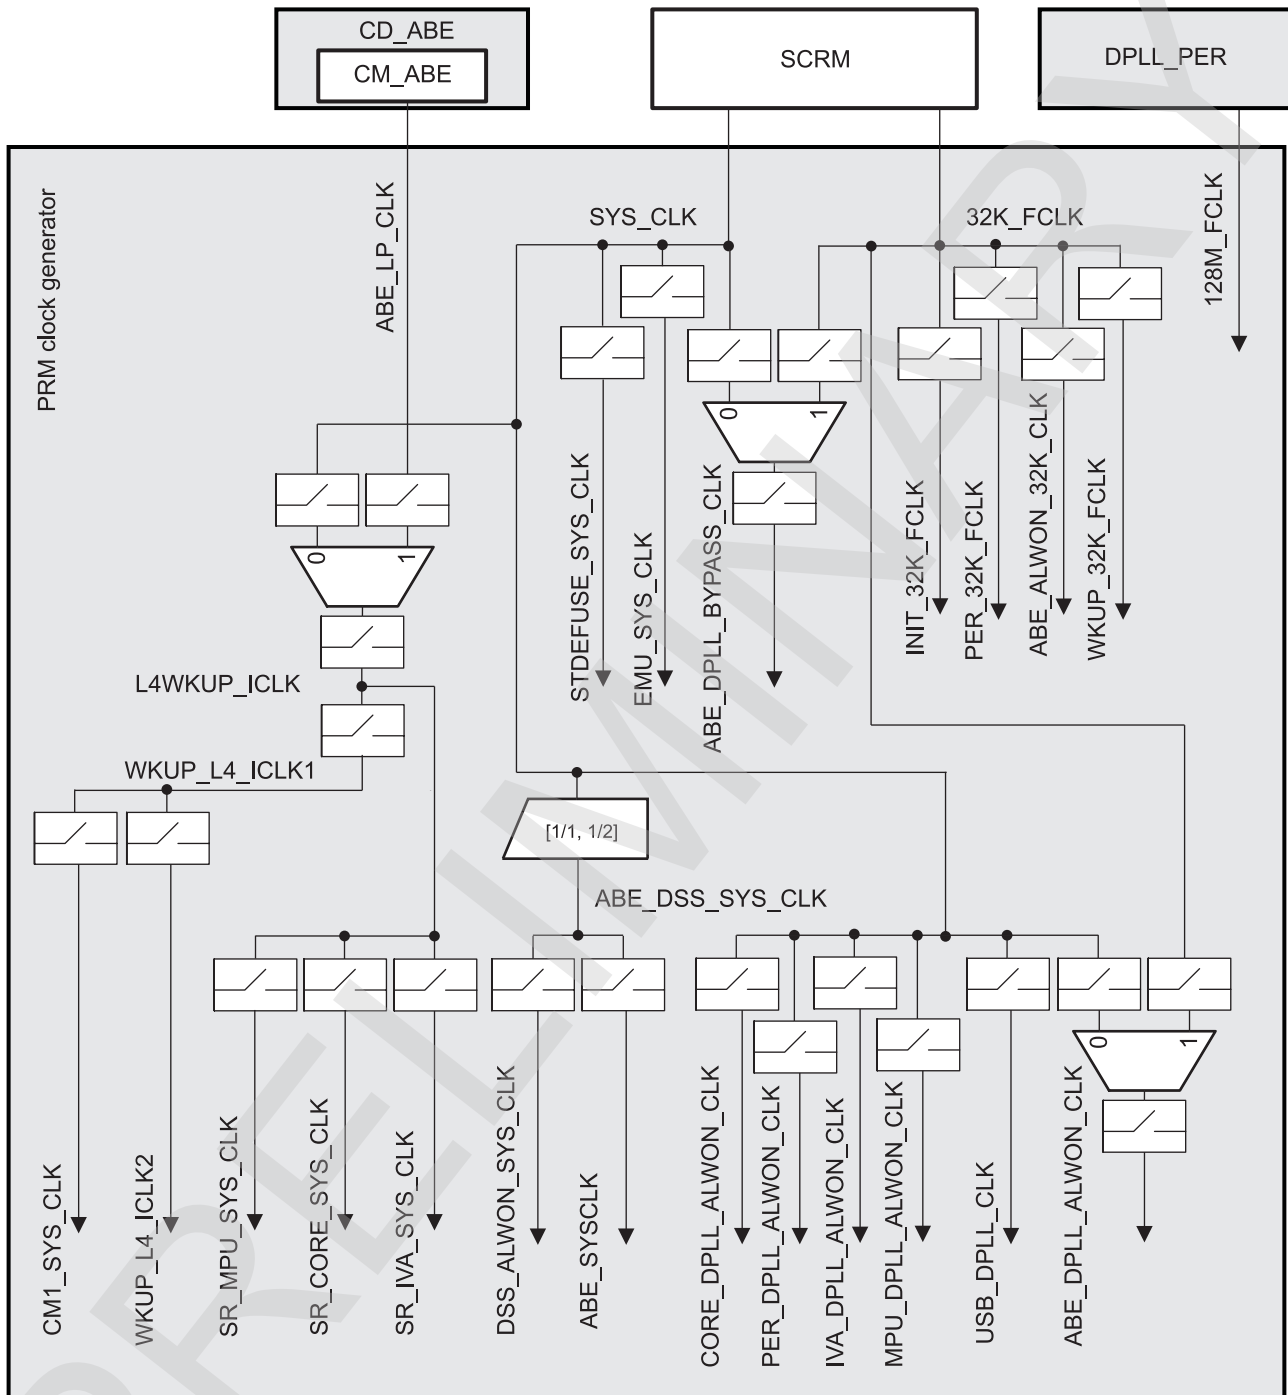

#### **3.6.3.1 PRM Clock Source**

The PRM clock source receives the SYS\_32K and SYS\_CLK clocks from the SCRM. It sources various versions (through gating controls) of these clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The SR modules with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- eFuse controller clocks (gated SYS\_CLK clock), which are permanently supplied with always-on buffers
- The clocks for CM clock generator and the CORE power domain
- A version of SYS\_CLK to ABE supplied by always-on buffers

[Figure 3-33](#) and [Figure 3-34](#) present a logical representation of the PRM clock source.

Figure 3-33. PRM Clock Manager Overview (a)

prcm-034

Figure 3-34. PRM Clock Manager Overview (b)

prcm-035

Table 3-34 identifies controls for clock dividers or muxes in the PRM.

Table 3-34. PRM Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Mux ABE_DPLL_ALWON_CLK	CM_ABE_PLL_REF_CLKSEL[0] CLKSEL
Mux GPT1_FCLK	CM_WKUP_GPTIMER1_CLKCTRL[24] CLKSEL
Mux GPT2_FCLK	CM_L4PER_GPTIMER2_CLKCTRL[24] CLKSEL
Mux GPT3_FCLK	CM_L4PER_GPTIMER3_CLKCTRL[24] CLKSEL
Mux GPT4_FCLK	CM_L4PER_GPTIMER4_CLKCTRL[24] CLKSEL
Mux GPT9_FCLK	CM_L4PER_GPTIMER9_CLKCTRL[24] CLKSEL
Mux GPT10_FCLK	CM_L4PER_GPTIMER10_CLKCTRL[24] CLKSEL
Mux GPT11_FCLK	CM_L4PER_GPTIMER11_CLKCTRL[24] CLKSEL
Mux L4WKUP_ICLK	CM_L4_WKUP_CLKSEL[0] CLKSEL
Mux ABE_DPLL_BYPASS_CLK	CM_L4_WKUP_CLKSEL[0] CLKSEL

PRM provides 32-kHz gated and ungated clock for use by portions of PD\_WKUP power domain and some peripherals outside the PD\_WKUP power domain.

It also provides the system clock to the display subsystem (DSS), and gated and buffered version to L4WKUP\_ICLK interconnect clock, and the DPLLs controlled by the PRCM module. The gated version of the SYS\_CLK is also provided to the SmartReflex modules of the device.

### 3.6.3.2 CM Clock Source

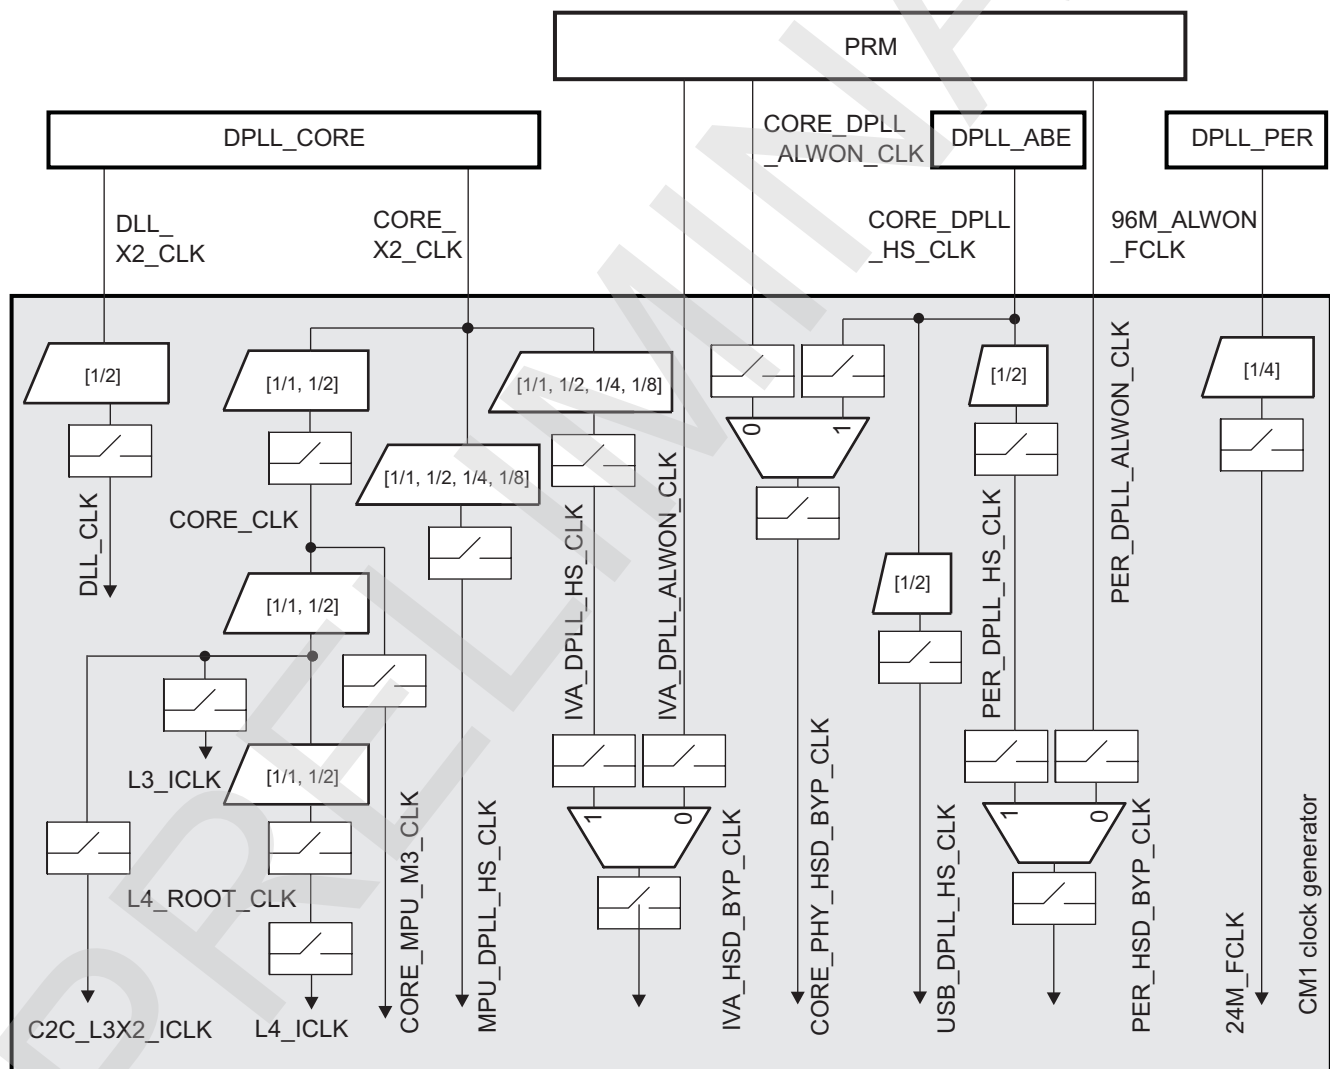

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL\_CORE and DPLL\_PER. The CM is physically divided into two independent entities, CM1 placed in PD\_ALWON\_CORE always-on power domain and CM2 placed in PD\_CORE switchable power domain. The split is done to provide control over various entities like modules, DPLLs and clocks during low power use case scenarios when the PD\_CORE power domain can be switched to RETENTION state.

#### 3.6.3.2.1 CM1 Clock Generator

CM1 receives system clock from the PRM, which serves as its functional clock. CM1 provides gated clock to PD\_AUDIO and some DPLLs. It also provides clock to the L3 and L4 interconnects in the device.

Figure 3-35 shows the various functional and interface clocks generated by CM1:

Figure 3-35. CM1 Overview

prcm-036

Table 3-35 identifies controls for clock dividers or muxes in the CM1 clock source.

**Table 3-35. CM1 Clock Division and Muxing Control**

Mux CORE_PHY_HSD_BYP_CLK	CM_CLKSEL_DPLL_CORE[23] DPLL_BYP_CLKSEL

**3.6.3.2.2 CM1\_USB Clock Generator**

CM\_USB receives system clock from USBPHY and DPLL\_USB. It provides gated clock to CD\_L3\_INIT.

Figure 3-36 shows the various functional and interface clocks generated by CM1\_USB:

**Figure 3-36. CM1\_USB Clock Manager Overview**

prcm-037

Table 3-36 identifies controls for clock dividers or muxes in the CM1\_USB clock source.

**Table 3-36. CM1\_USB Clock Division and Muxing Control**

Mux OTG_60M_FCLK	CM_L3INIT_HSUSBOTG_CLKCTRL[24] CLKSEL_6 0M

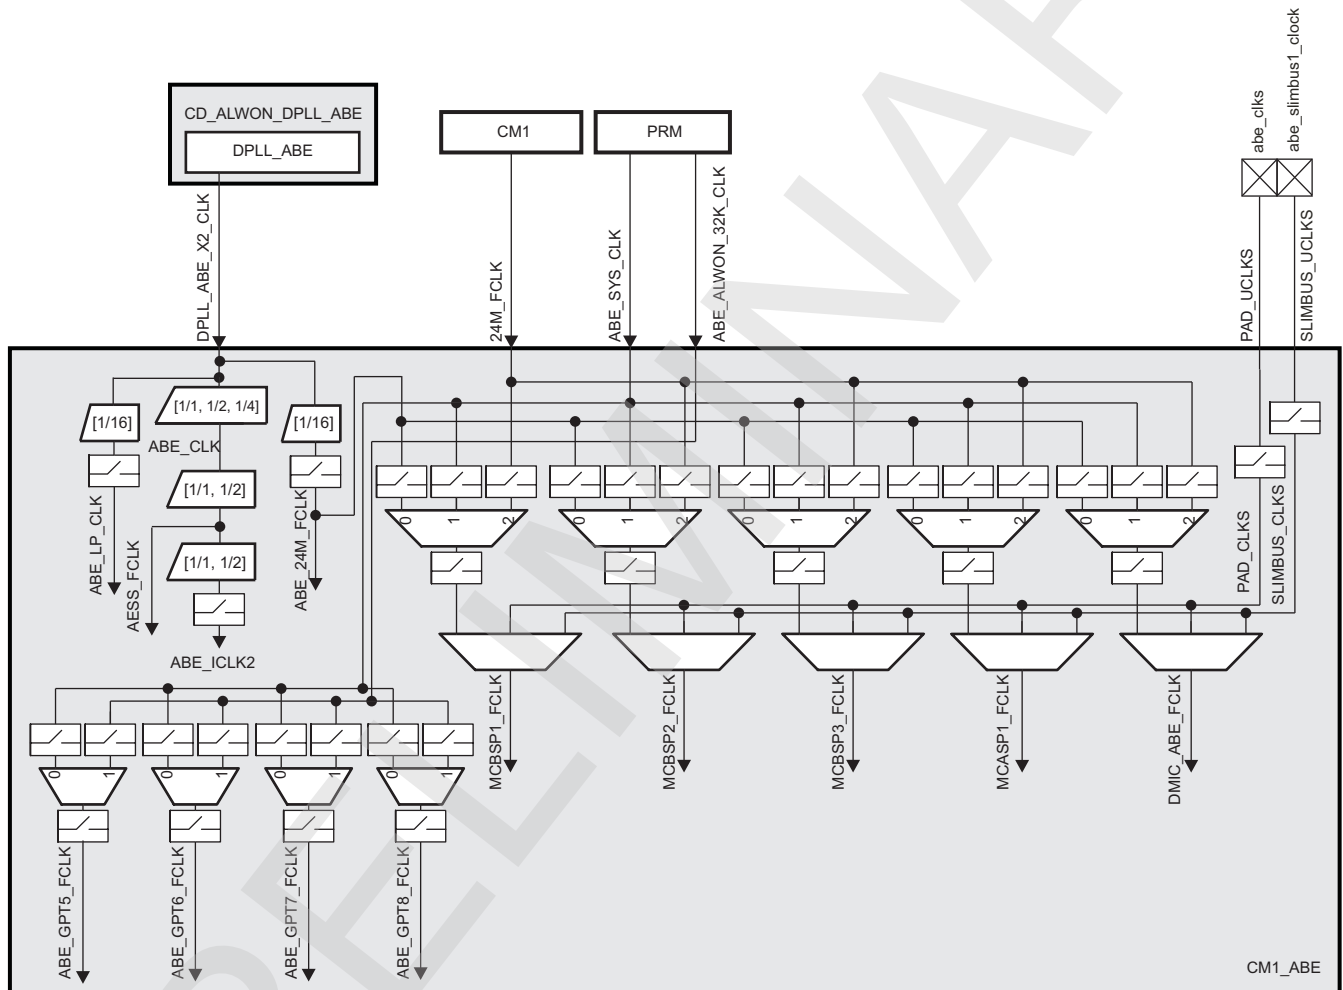

**NOTE:** For the clock status bits see [Table 3-117](#)

### 3.6.3.2.3 CM1\_ABE Clock Generator

CM1\_ABE receives system clock from PRM. It provides gated clock to CD\_L4\_PER.

Figure 3-37 show the various functional and interface clocks generated by CM1\_ABE clock source.

**Figure 3-37. CM1\_ABE Clock Manager Overview**

prcm-038

Table 3-37 identifies controls for clock dividers or muxes in the CM1\_ABE.

Mux MCBSP1_INT_FCLK	CM1_ABE_MCBSP1_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCBSP2_FCLK	CM1_ABE_MCBSP2_CLKCTRL[25:24] CLKSEL_SOURCE
Mux MCBSP2_INT_FCLK	CM1_ABE_MCBSP2_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE
Mux MCBSP3_FCLK	CM1_ABE_MCBSP3_CLKCTRL[25:24] CLKSEL_SOURCE
Mux MCBSP3_INT_FCLK	CM1_ABE_MCBSP3_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE

(1) ABE\_ICLK2 depends on the divider settings of the AESS\_FCLK and is always divided by 2 of the ABE\_CLK. So when AESS\_FCLK divider is set to 1, then ABE\_ICLK2 divider is set to 2 and vice versa.

#### 3.6.3.2.4 CM2 Clock Generator

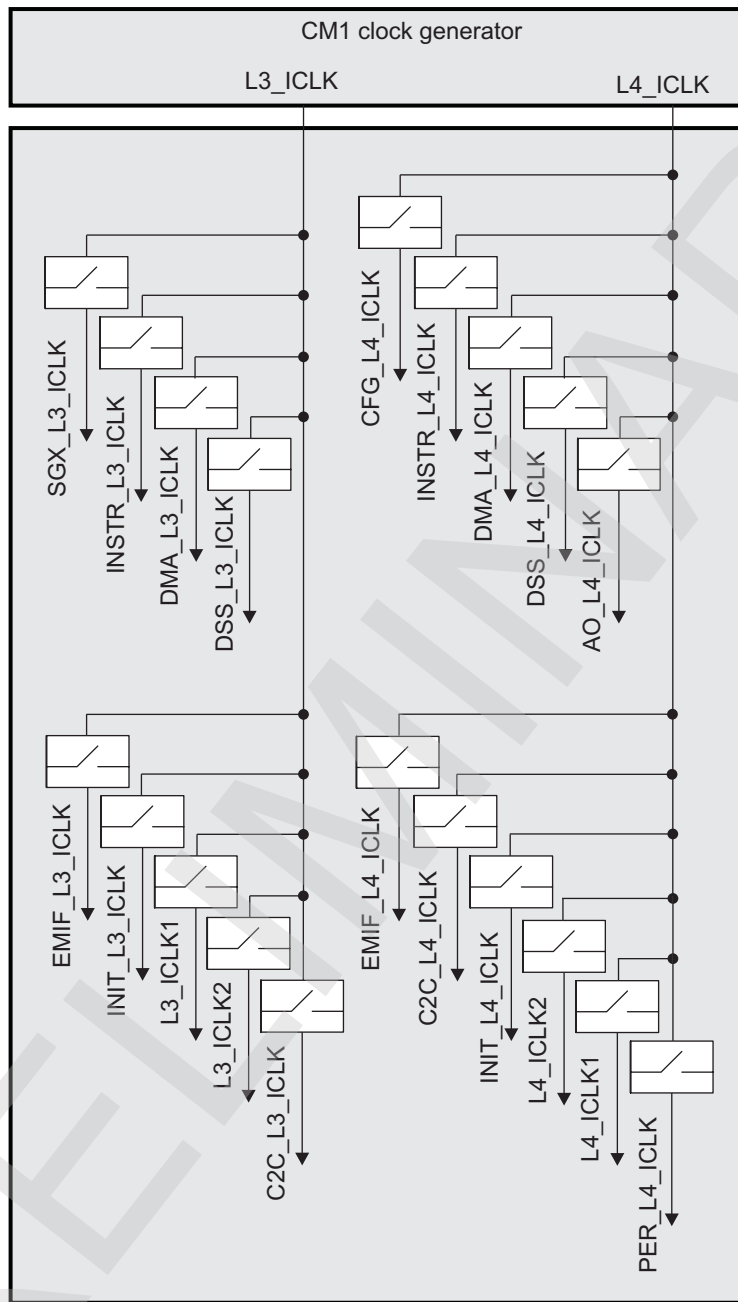

CM2 provides gated functional clocks to various modules of the device.

Figure 3-38 and Figure 3-39 show the various functional and interface clocks generated by CM2:

Figure 3-38. CM2 Overview (a)

prcm-039

**Figure 3-39. CM2 Overview (b)**

prcm-040

Table 3-38 identifies controls for clock dividers or muxes in the CM2 clock source.

**Table 3-38. CM2 Clock Division and Muxing Control**

Divider/Mux	Control Bit Field
Divider FDIF_FCLK	CM_CAM_FDIF_CLKCTRL[25:24] CLKSEL_FCLK

### 3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types, identified as type A and type B DPLLs.

Following DPLLs belong to type A:

- DPLL\_MPU
- DPLL\_IVA
- DPLL\_CORE
- DPLL\_PER
- DPLL\_ABE

Following DPLLs belong to type B:

- DPLL\_USB

All DPLLs support the features presented in the following sections, unless identified otherwise.

---

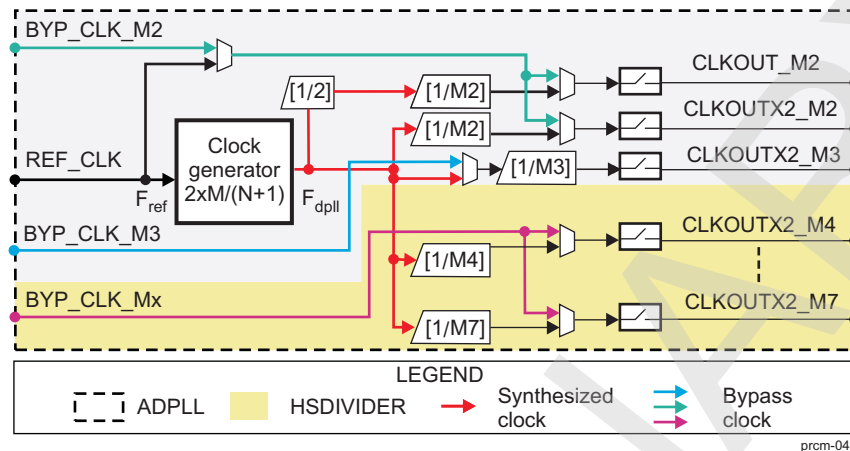

**NOTE:** This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are covered in the description of their respective subsystems. For example, [Chapter 10, Display Subsystem](#), discusses the DPLL in the display subsystem.

---

### 3.6.3.3.1 DPLLs Output Clocks Parameters

Figure 3-40 shows the functional architecture of a generic DPLL.

**Figure 3-40. Generic DPLL Functional Diagram**

The DPLL has three input clocks:

- REF\_CLK: used to generate the synthesized clock but can also be used as the bypass clock for two outputs of the DPLL, whenever the DPLL enters a bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP\_CLK\_M2: Selectable bypass clock for the output of an M2 post-divider (optional).
- BYP\_CLK\_M3: Selectable bypass clock for the output of an M3 post-divider (optional).

The DPLL can be programmed to be locked at any frequency given by the following equation:

- $F_{dppll} = F_{ref} \times 2 \times M / (N + 1)$  or
- $F_{dppll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$  in case REGM4XEN bit field is set (only applicable to DPLL\_ABE).

Where:

- $F_{dppll}$  is the DPLL lock frequency.
- $F_{ref}$  is the REF\_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

It internally generates three main clocks: CLKOUT\_M2, CLKOUTX2\_M2, and CLKOUTX2\_M3 as presented in Table 3-39.

**Table 3-39. CLKOUT\_M2, CLKOUTX2\_M2, and CLKOUTX2\_M3 Frequencies With DPLL State**

Output	Equation	DPLL Mode
CLKOUT_M2	$F_{dppll} / (2 \times M2)$	Locked
	$F_{dppll}$ or BYP_CLK_M2	Before lock or during relock
CLKOUTX2_M2	$F_{dppll} / M2$	Locked
	$F_{dppll}$ or BYP_CLK_M2	Before lock or during relock
CLKOUTX2_M3	$F_{dppll} / M3$ or BYP_CLK_M3 / M3	Locked
	0	Before lock or during relock

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT\_M2 and CLKOUTX2\_M2 bypass clock input can be switched when the DPLL is not in locked state, using the M2 Bypass Clock Select Control bit.
- CLKOUTX2\_M3 output clock can be switched when the DPLL is in locked state, using the M3 Clock

Select Control bit.

**NOTE:**

- Zero-value for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT\_M2 is generated based on a fix divide-by-2 ratio, except in bypass mode.

The DPLL may contain an HSDIVIDER module to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER provides four extra post-dividers from M4 to M7. The HSDIVIDER output clocks frequency is given by the equations in [Table 3-40](#):

**Table 3-40. CLKOUTX2\_Mn Frequencies With DPLL State**

Equation	DPLL Mode
$\text{CLKOUTX2\_Mn} = \text{Fdpll}/\text{Mn}$	Locked
$\text{CLKOUTX2\_Mn} = \text{BYP\_CLK\_Mx}$	Before lock or during relock

Where:

- Fdpll is the DPLL lock frequency.
- Mn is the software configured division ratio binary value.
- n is in the range from 4 to 7.

**NOTE:**

- Mn division ratio is set to 1 after reset and 31 (0x1f) is an illegal value.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated.

The type B DPLL (only DPLL\_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $\text{Fclkout} = \text{Fref} \times (\text{M}/(\text{N}+1)) \times (1/\text{M}2)$
- $\text{Fclkdcoldo} = \text{Fref} \times (\text{M}/(\text{N}+1))$

Where:

- Fclkout is the frequency of the clock at output CLKOUT.
  - Fclkdcoldo is the frequency of the clock at output CLKDCOLDO.
  - Fref is the REF\_CLK frequency.
  - M is the software-configured multiplication ratio binary value.
  - N is the software-configured division ratio binary value.
  - M2 is the software-configured division ratio binary value.
- CLKOUT supports the same bypass modes as identified earlier. CLKDCOLDO does not support bypass mode.

### 3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a Manual Mode Control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence, to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The DPLL can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software enabled using the low-power mode control bit of the DPLL.

It must only be enabled if both of the following operating conditions are satisfied:

- $F_{ref}/(N+1)$  is less than or equal to 1 MHz.
- $F_{ref} \times M/(N+1)$  is less than or equal to 100 MHz.

With:

- $F_{ref}$  is the REF\_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

### 3.6.3.3.3 DPLL Power Modes

DPLL may supports several power modes. Each mode results in a tradeoff between power savings and relock time.

Table 3-41 shows the DPLL power modes.

**Table 3-41. DPLL Power Modes**

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (20 \times 1/F_{ref})$	$1.5 \mu\text{s} + (100 \times 1/F_{ref})$
Fast-relock stop	Clock stopped	0.05 (leakage)	0.25 (leakage)	$0.05 \mu\text{s} + (20 \times 1/F_{ref})$	$0.05 \mu\text{s} + (100 \times 1/F_{ref})$
MN bypass	Bypass clock	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (350 \times 1/F_{ref})$	$1.5 \mu\text{s} + (500 \times 1/F_{ref})$
Low-power bypass	Bypass clock/Clock stopped	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (20 \times 1/F_{ref})$	$1.5 \mu\text{s} + (100 \times 1/F_{ref})$
Fast-relock bypass	Bypass clock/Clock stopped	0.05 (leakage)	0.25 (leakage)	$0.05 \mu\text{s} + (20 \times 1/F_{ref})$	$0.05 \mu\text{s} + (100 \times 1/F_{ref})$
Lock	Synthesized clock	0.55 (active)	1.95 (active)	N/A	N/A

Where:

- $F_{ref}$  is the REF\_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to the other as a result of the following:

- Software-programmed transition (manual): The software configures the dedicated DPLL Manual Mode Control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than MN BYPASS and the LOCK state) when the output clocks are gated or the destination clock domain is inactive. And to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in dedicated Auto Mode Control parameter of the DPLL.

**NOTE:** With REF\_CLK period =  $1/F_{ref} = (N + 1)/CLKINP$ ; ( $F_{ref} = CLKINP/(N + 1)$ ):

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
- Results in a higher DPLL lock frequency, and then higher power consumption.

**NOTE:**

- A manual transition can be performed from any power mode to any other power mode.
- An automatic transition can be performed from lock mode to any low-power mode, except for the MN bypass mode.

**3.6.3.3.4 DPLL Recalibration**

Each time the DPLL is reset or performs a lock sequence (following a change in multiplier M or divider N value), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In the locked mode the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

**NOTE:**

- The recalibration mechanism is active only while the DPLL is in locked mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
- If the DPLL drifts out of the operating range limits while not locked, then when it tries to relock it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the Recalibration-Enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

**NOTE:**

Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory (EMIF) controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow the software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on processor power domain followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-42 shows the DPLL recalibration and control parameters.

**Table 3-42. DPLL Recalibration Control Parameters**

Parameter	Description
Recalibration-Enable control	Enable/disable the DPLL automatic recalibration feature.

**Table 3-42. DPLL Recalibration Control Parameters (continued)**

Parameter	Description
Recalibration-Interrupt mask control	Mask/unmask the DPLL recalibration interrupt to processor.
Recalibration-Interrupt status	Status of the DPLL recalibration interrupt to processor

### 3.6.3.3.5 DPLL Spread Spectrum Clocking

The synthesized clock output of the DPLL has a stable frequency. This periodicity generates a significant power peak at the selected frequency, which in turn causes an electromagnetic interference (EMI) disturbance to the environment. In communication devices, this clock signal generates unwanted spurious signals that interfere with the decoding of information received. It results in performance degradation, for example, in the form of high bit-error rates in case of a wireless communication interface.

To reduce the power peaks (and the electromagnetic noise generated at a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thus reducing the power peaks. This is called spread spectrum clocking (SSC).

SSC in the DPLL is performed by changing the feedback divider (M) in a triangular pattern. This varies the frequency of the output clock in a triangular pattern. The frequency of this pattern is the modulation frequency (fm). It is programmed as a ratio of the REF\_CLK/4. It is given as:

$$f_m = (\text{REF\_CLK}/4) * (1/\text{ModFreqDivider})$$

Where: ModFreqDivider is the value of the modulation frequency divider and is given as:

$$\text{ModFreqDivider} = \text{Mantissa} * 2^{\text{Exponent}}$$

The Mantissa and Exponent are configurable parameters of the DPLL.

The ratio of output frequency variation (that is, frequency spread Df) with respect to the programmed synthesized frequency Fout of the DPLL is equal to the ratio of peak (M) or the amplitude of the SSC modulation with feedback divider (M).

$$M/M = f/F_{out}$$

The frequency spread (Df), can thus be controlled by configuring the amplitude of modulation (M). The M is controlled by setting the step size of variation of M (that is, DeltaMStep) for a given REF\_CLK.

$$M = \text{ModFreqDivider} * \text{DeltaMStep}$$

Where: DeltaMStep is split into integer part and fractional part.

Table 3-43 shows the DPLL SSC control parameters.

**Table 3-43. DPLL SSC Control Parameters**

Parameter	Description
SSC enable control	Enable/disable the DPLL SSC feature. When set to disable, SSC is disabled only after completion of one full cycle of the modulation pattern to maintain the average frequency.
SSC acknowledge	Notifies the exact start and end of SSC
Modulation Frequency Divider setting (Mantissa and Exponent)	Set the ratio of the modulation frequency with respect to the REF_CLK/4 frequency.
M step size setting (DeltaMStepInteger and DeltaMStepFraction)	Set the feedback divider variation step-size.

### 3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically re-enables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Similarly, all the output dividers (M2, M3, and the Mn) can be powered down when their output clocks are gated and powered up when the clocks are needed again.

**Table 3-44. DPLL Power-Down Control Parameters**

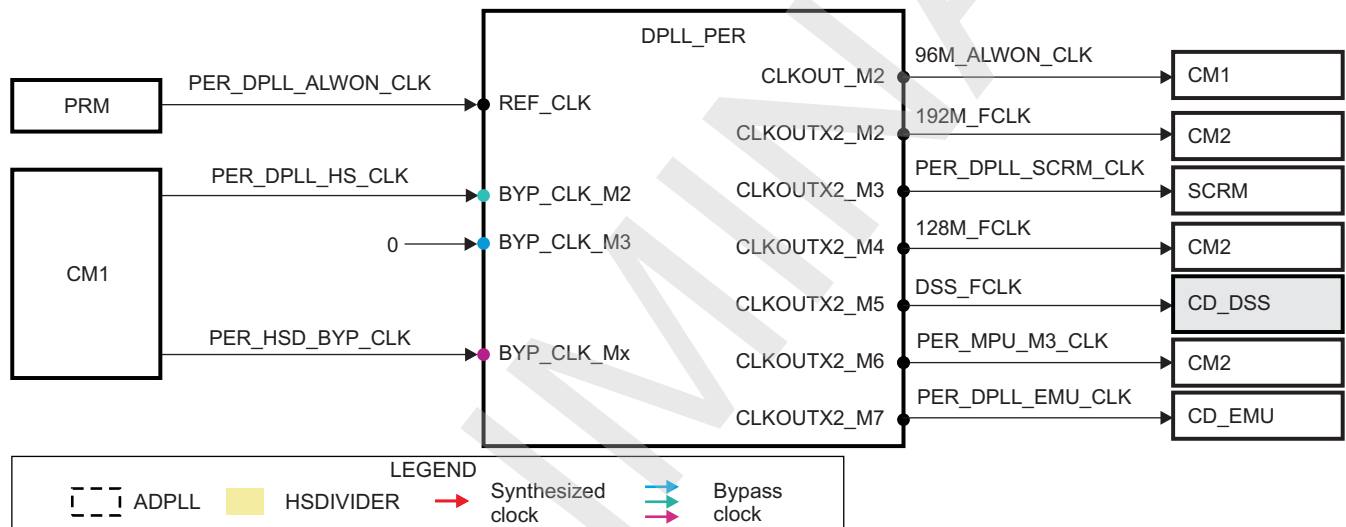

Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if the all the output dividers are power-down.
M2, M3, and Mn (where n = 4 to 7)	Enables/disables automatic power-down feature of the corresponding output divider if the output clocks of the divider are gated.

### 3.6.3.4 DPLL\_PER Description

#### 3.6.3.4.1 Overview

Figure 3-41 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

**Figure 3-41. DPLL\_PER Overview**

prcm-042

#### 3.6.3.4.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-45 lists the clock synthesis parameters of the DPLL.

**Table 3-45. DPLL\_PER Clock Synthesis Parameters**

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_PER[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_PER[6:0] DPLL_DIV

Table 3-46 lists the clock output divider parameters of the DPLL.

**Table 3-46. DPLL\_PER Clock Output Parameters**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_PER[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_PER[8] DPLL_CLKOUT_GATE_CTRL

**Table 3-46. DPLL\_PER Clock Output Parameters (continued)**

CLKOUTX2_M7	Divider Acknowledge	CM_DIV_M7_DPLL_PER[5] HSDIVIDER_CLKOUT4_DIVCHACK
CLKOUTX2_M7	Divider Control	CM_DIV_M7_DPLL_PER[4:0] HSDIVIDER_CLKOUT4_DIV

### 3.6.3.4.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-47](#) lists the operating modes supported by the DPLL.

**Table 3-47. DPLL\_PER Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (default)	Available	Available	Available

Table 3-48 lists the control bit fields for the operating mode control of the DPLL.

**Table 3-48. DPLL\_PER Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_PER[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_PER[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_PER[2:0] AUTO_DPLL_MODE

#### 3.6.3.4.4 Recalibration

Table 3-49 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

**Table 3-49. DPLL\_PER Recalibration Feature Parameters**

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_PER[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[3] DPLL_PER_RECAL_ST
Recalibration - Interrupt MASK Control	PRM_IRQENABLE_MPU_A9[3] DPLL_PER_RECAL_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_M3[3] DPLL_PER_RECAL_ST
Recalibration - Interrupt MASK Control	PRM_IRQENABLE_MPU_M3[3] DPLL_PER_RECAL_EN

#### 3.6.3.4.5 Spread Spectrum Clocking

Table 3-50 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

**Table 3-50. DPLL\_PER Spread-Spectrum Clocking Feature Parameters**

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_PER[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_PER[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_PER[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_PER[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_PER[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_PER[6:0] MODFREQDIV_MANTISSA

#### 3.6.3.4.6 Output Power Down

Table 3-51 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power-Down*, for an explanation of the DPLL output power down feature.

**Table 3-51. DPLL\_PER Clock Output Power-down Parameters**

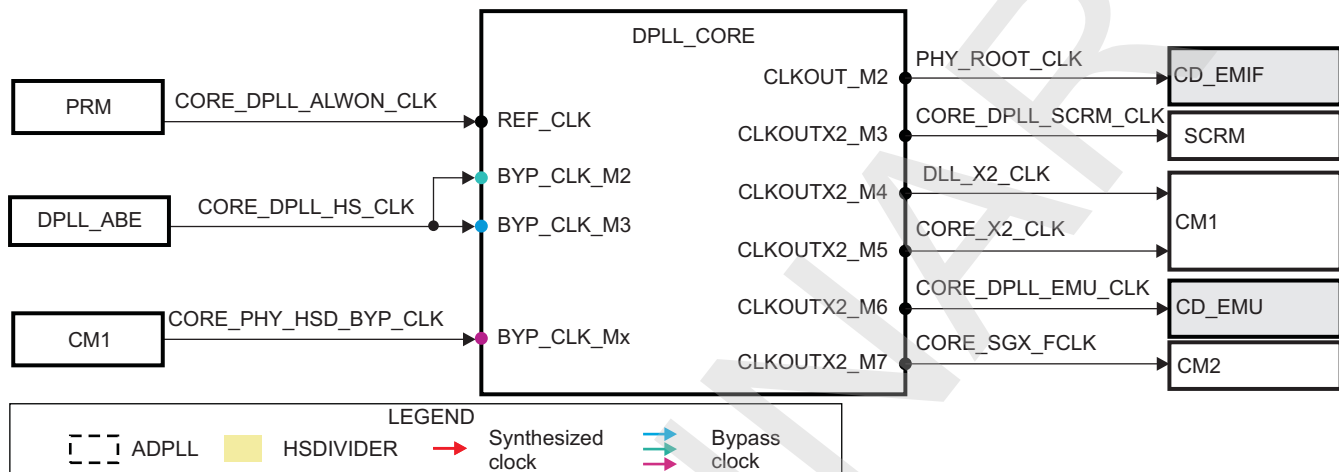

Parameter Name	Control/Status Bit Field
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_PER[12] HSDIVIDER_CLKOUT1_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_PER[12] HSDIVIDER_CLKOUT2_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_PER[12] HSDIVIDER_CLKOUT3_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_PER[12] HSDIVIDER_CLKOUT4_PWDN

### 3.6.3.5 DPLL\_CORE Description

#### 3.6.3.5.1 Overview

Figure 3-42 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

Figure 3-42. DPLL\_CORE Overview

prcm-043

#### 3.6.3.5.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-52 lists the clock synthesis parameters of the DPLL.

Table 3-52. DPLL\_CORE Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_CORE[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_CORE[6:0] DPLL_DIV
M (Restore)	CM_CLKSEL_DPLL_CORE_RESTORE[18:8] DPLL_MULT
N (Restore)	CM_CLKSEL_DPLL_CORE_RESTORE[6:0] DPLL_DIV

Table 3-53 lists the clock output divider parameters of the DPLL.

Table 3-53. DPLL\_CORE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_CORE[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_CORE[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_CORE[5] DPLL_CLKOUT_DIVCHACK
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_CORE[4:0] DPLL_CLKOUT_DIV
CLKOUTX2_M3	Status	CM_DIV_M3_DPLL_CORE[9] ST_DPLL_CLKOUTHIF
CLKOUTX2_M3	Gating Control	CM_DIV_M3_DPLL_CORE[8] DPLL_CLKOUTHIF_GATE_CTRL

**Table 3-53. DPLL\_CORE Clock Output Parameters (continued)**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_M3	Divider Acknowledge	CM_DIV_M3_DPLL_CORE[5] DPLL_CLKOUTHIF_DIVCHACK
CLKOUTX2_M3	Divider Control	CM_DIV_M3_DPLL_CORE[4:0] DPLL_CLKOUTHIF_DIV
CLKOUTX2_M4	Status	CM_DIV_M4_DPLL_CORE[9] ST_HSDIVIDER_CLKOUT1
CLKOUTX2_M4	Gating Control	CM_DIV_M4_DPLL_CORE[8] HSDIVIDER_CLKOUT1_GATE_CTRL
CLKOUTX2_M4	Divider Acknowledge	CM_DIV_M4_DPLL_CORE[5] HSDIVIDER_CLKOUT1_DIVCHACK
CLKOUTX2_M4	Divider Control	CM_DIV_M4_DPLL_CORE[4:0] HSDIVIDER_CLKOUT1_DIV
CLKOUTX2_M5	Status	CM_DIV_M5_DPLL_CORE[9] ST_HSDIVIDER_CLKOUT2
CLKOUTX2_M5	Gating Control	CM_DIV_M5_DPLL_CORE[8] HSDIVIDER_CLKOUT2_GATE_CTRL

CLKOUTX2_M5	Divider Control	CM_DIV_M5_DPLL_CORE[4:0] HSDIVIDER_CLKOUT2_DIV
CLKOUTX2_M6	Status	CM_DIV_M6_DPLL_CORE[9] ST_HSDIVIDER_CLKOUT3
CLKOUTX2_M6	Gating Control	CM_DIV_M6_DPLL_CORE[8] HSDIVIDER_CLKOUT3_GATE_CTRL
CLKOUTX2_M6	Divider Acknowledge	CM_DIV_M6_DPLL_CORE[5] HSDIVIDER_CLKOUT3_DIVCHACK
CLKOUTX2_M6	Divider Control	CM_DIV_M6_DPLL_CORE[4:0] HSDIVIDER_CLKOUT3_DIV
CLKOUTX2_M7	Status	CM_DIV_M7_DPLL_CORE[9] ST_HSDIVIDER_CLKOUT4
CLKOUTX2_M7	Gating Control	CM_DIV_M7_DPLL_CORE[8] HSDIVIDER_CLKOUT4_GATE_CTRL
CLKOUTX2_M7	Divider Acknowledge	CM_DIV_M7_DPLL_CORE[5] HSDIVIDER_CLKOUT4_DIVCHACK
CLKOUTX2_M7	Divider Control	CM_DIV_M7_DPLL_CORE[4:0] HSDIVIDER_CLKOUT4_DIV

### 3.6.3.5.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-54](#) lists the operating modes supported by the DPLL.

**Table 3-54. DPLL\_CORE Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (default)	Available	Available	Available

[Table 3-55](#) lists the control bit fields for the operating mode control of the DPLL.

**Table 3-55. DPLL\_CORE Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_CORE[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_CORE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_CORE[2:0] AUTO_DPLL_MODE
Low-Power Mode Control (Restore)	CM_CLKMODE_DPLL_CORE_RESTORE[10] DPLL_LPMODE_EN
Manual Mode Control (Restore)	CM_CLKMODE_DPLL_CORE_RESTORE[2:0] DPLL_EN
Auto Mode Control (Restore)	CM_AUTOIDLE_DPLL_CORE_RESTORE[2:0] AUTO_DPLL_MODE

### 3.6.3.5.4 Recalibration

Table 3-56 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

**Table 3-56. DPLL\_CORE Recalibration Feature Parameters**

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_CORE[8] DPLL_DRIFTGUARD_EN
Recalibration - Enable Control	CM_CLKMODE_DPLL_CORE_RESTORE[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[0] DPLL_CORE_RECAL_ST
Recalibration - Interrupt mask Control	PRM_IRQENABLE_MPU_A9[0] DPLL_CORE_RECAL_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_M3[0] DPLL_CORE_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_M3[0] DPLL_CORE_RECAL_EN

### 3.6.3.5.5 Spread Spectrum Clocking

Table 3-57 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

**Table 3-57. DPLL\_CORE Spread-Spectrum Clocking Feature Parameters**

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_CORE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_CORE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_CORE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_CORE[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_CORE[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_CORE[6:0] MODFREQDIV_MANTISSA
Restore Modulation Step Size setting	CM_SSC_DELTAMSTEP_DPLL_CORE_RESTORE[19:0] DELTAMSTEP
Restore Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[10:8] MODFREQDIV_EXPONENT
Restore Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[6:0] MODFREQDIV_MANTISSA
Restore SSC Downspread	CM_CLKMODE_DPLL_CORE_RESTORE[14] DPLL_SSC_DOWNSPREAD
Restore SSC Acknowledge	CM_CLKMODE_DPLL_CORE_RESTORE[13] DPLL_SSC_ACK
Restore SSC Enable Control	CM_CLKMODE_DPLL_CORE_RESTORE[12] DPLL_SSC_EN

### 3.6.3.5.6 Output Power-Down

Table 3-58 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power Down*, for an explanation of the DPLL output power-down feature.

**Table 3-58. DPLL\_CORE Clock Output Power-Down Parameters**

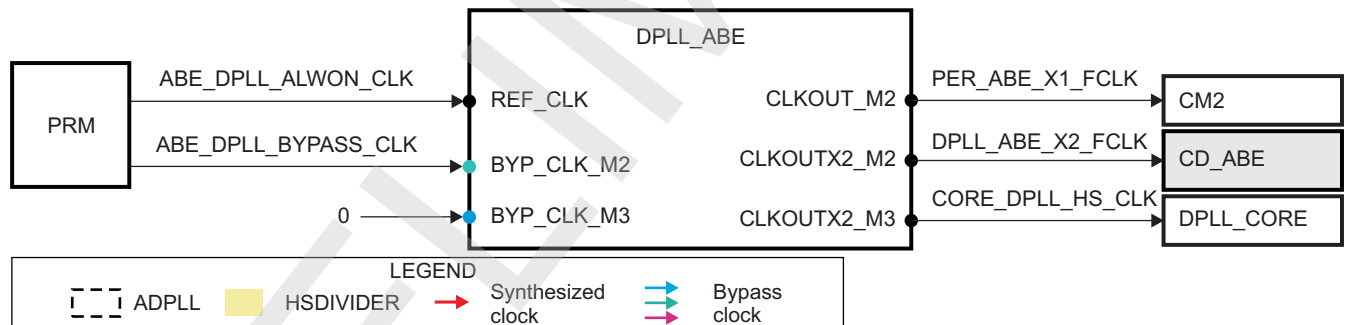

Parameter Name	Control/Status Bit Field
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_CORE[12] HSDIVIDER_CLKOUT1_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_CORE[12] HSDIVIDER_CLKOUT2_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_CORE[12] HSDIVIDER_CLKOUT3_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_CORE[12] HSDIVIDER_CLKOUT4_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_CORE_RESTORE[12] HSDIVIDER_CLKOUT1_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_CORE_RESTORE[12] HSDIVIDER_CLKOUT2_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_CORE_RESTORE[12] HSDIVIDER_CLKOUT3_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_CORE_RESTORE[12] HSDIVIDER_CLKOUT4_PWDN

### 3.6.3.6 DPLL\_ABE Description

#### 3.6.3.6.1 Overview

Figure 3-43 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

**Figure 3-43. DPLL\_ABE Overview**

prcm-044

#### 3.6.3.6.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-59 lists the clock synthesis parameters of the DPLL.

**Table 3-59. DPLL\_ABE Clock Synthesis Parameters**

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_ABE[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_ABE[6:0] DPLL_DIV

Table 3-60 lists the clock output divider parameters of the DPLL.

**Table 3-60. DPLL\_ABE Clock Output Parameters**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_ABE[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_ABE[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_ABE[5] DPLL_CLKOUT_DIVCHACK
CLKOUTX2_M2	Status	CM_DIV_M2_DPLL_ABE[11] ST_DPLL_CLKOUTX2
CLKOUTX2_M2	Gating Control	CM_DIV_M2_DPLL_ABE[10] DPLL_CLKOUTX2_GATE_CTRL
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_ABE[4:0] DPLL_CLKOUT_DIV
CLKOUTX2_M3	Status	CM_DIV_M3_DPLL_ABE[9] ST_DPLL_CLKOUTHIF
CLKOUTX2_M3	Gating Control	CM_DIV_M3_DPLL_ABE[8] DPLL_CLKOUTHIF_GATE_CTRL
CLKOUTX2_M3	Divider Acknowledge	CM_DIV_M3_DPLL_ABE[5] DPLL_CLKOUTHIF_DIVCHACK
CLKOUTX2_M3	Divider Control	CM_DIV_M3_DPLL_ABE[4:0] DPLL_CLKOUTHIF_DIV

### 3.6.3.6.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See Section 3.6.3.3.2, *Enable Control, Status and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Mode*, for an explanation of the DPLL operating modes, and associated control and status features.

Table 3-61 lists the operating modes supported by the DPLL.

**Table 3-61. DPLL\_ABE Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (Default)	Available	Available	Available

Table 3-62 lists the control bit fields for the operating mode control of the DPLL.

**Table 3-62. DPLL\_ABE Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_ABE[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_ABE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_ABE[2:0] AUTO_DPLL_MODE

### 3.6.3.6.4 Recalibration

Table 3-63 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

**Table 3-63. DPLL\_ABE Recalibration Feature Parameters**

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_ABE[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[4] DPLL_ABE_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_A9[4] DPLL_ABE_RECAL_EN

### 3.6.3.6.5 Spread Spectrum Clocking

Table 3-64 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

**Table 3-64. DPLL\_ABE Spread-Spectrum Clocking Feature Parameters**

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_ABE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_ABE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_ABE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_ABE[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_ABE[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_ABE[6:0] MODFREQDIV_MANTISSA

### 3.6.3.7 DPLL\_MPU Description

#### 3.6.3.7.1 Overview

Figure 3-44 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

**Figure 3-44. DPLL\_MPU Overview**

prcm-045

#### 3.6.3.7.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-65 lists the clock synthesis parameters of the DPLL.

**Table 3-65. DPLL\_MPU Clock Synthesis Parameters**

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_MPU[6:0] DPLL_DIV

Table 3-66 lists the clock output divider parameters of the DPLL.

**Table 3-66. DPLL\_MPU Clock Output Parameters**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_MPU[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_MPU[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_MPU[5] DPLL_CLKOUT_DIVCHACK

**Table 3-66. DPLL\_MPU Clock Output Parameters (continued)**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_MPU[4:0] DPLL_CLKOUT_DIV

### 3.6.3.7.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-67](#) lists the operating modes supported by the DPLL.

**Table 3-67. DPLL\_MPU Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (Default)	Available	Available	Available

[Table 3-68](#) lists the control bit fields for the operating mode control of the DPLL.

**Table 3-68. DPLL\_MPU Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

### 3.6.3.7.4 Recalibration

[Table 3-69](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

**Table 3-69. DPLL\_MPU Recalibration Feature Parameters**

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[1] DPLL_MPU_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_A9[1] DPLL_MPU_RECAL_EN

### 3.6.3.7.5 Spread Spectrum Clocking

[Table 3-70](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

**Table 3-70. DPLL\_MPU Spread-Spectrum Clocking Feature Parameters**

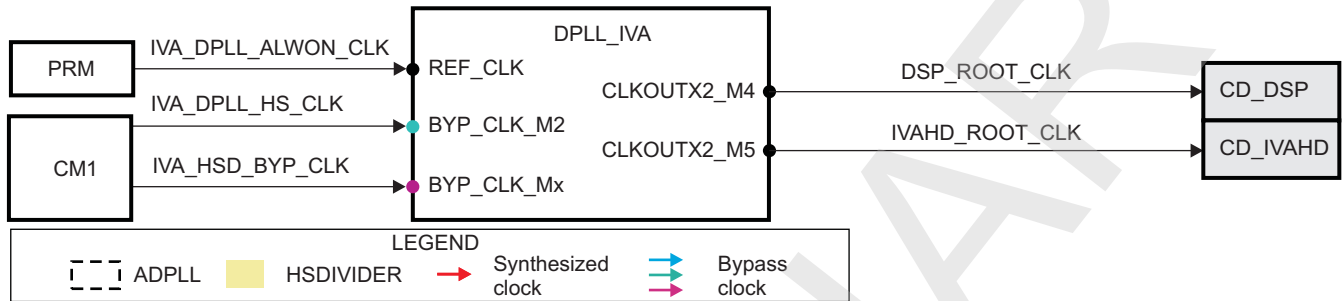

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_MPU[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_MPU[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_MPU[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_MPU[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_MPU[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_MPU[6:0] MODFREQDIV_MANTISSA

### 3.6.3.8 DPLL\_IVA Description

#### 3.6.3.8.1 Overview

Figure 3-45 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

Figure 3-45. DPLL\_IVA Overview

prcm-046

#### 3.6.3.8.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-71 lists the clock synthesis parameters of the DPLL.

Table 3-71. DPLL\_IVA Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_IVA[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_IVA[6:0] DPLL_DIV

Table 3-72 lists the clock output divider parameters of the DPLL.

Table 3-72. DPLL\_IVA Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_M4	Status	CM_DIV_M4_DPLL_IVA[9] ST_HSDIVIDER_CLKOUT1
CLKOUTX2_M4	Gating Control	CM_DIV_M4_DPLL_IVA[8] HSDIVIDER_CLKOUT1_GATE_CTRL
CLKOUTX2_M4	Divider Acknowledge	CM_DIV_M4_DPLL_IVA[5] HSDIVIDER_CLKOUT1_DIVCHACK
CLKOUTX2_M4	Divider Control	CM_DIV_M4_DPLL_IVA[4:0] HSDIVIDER_CLKOUT1_DIV
CLKOUTX2_M5	Status	CM_DIV_M5_DPLL_IVA[9] ST_HSDIVIDER_CLKOUT2
CLKOUTX2_M5	Gating Control	CM_DIV_M5_DPLL_IVA[8] HSDIVIDER_CLKOUT2_GATE_CTRL
CLKOUTX2_M5	Divider Acknowledge	CM_DIV_M5_DPLL_IVA[5] HSDIVIDER_CLKOUT2_DIVCHACK
CLKOUTX2_M5	Divider Control	CM_DIV_M5_DPLL_IVA[4:0] HSDIVIDER_CLKOUT2_DIV

### 3.6.3.8.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#) and [Section 3.6.3.3.3, DPLL Power Modes](#) for explanation on the DPLL operating modes, and associated control and status features.

[Table 3-73](#) presents the operating modes supported by the DPLL.

**Table 3-73. DPLL\_IVA Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (Default)	Available	Available	Available

[Table 3-74](#) presents the control bit fields for the operating mode control of the DPLL.

**Table 3-74. DPLL\_IVA Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_IVA[10] DPLL_LP_MODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_IVA[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_IVA[2:0] AUTO_DPLL_MODE

### 3.6.3.8.4 Recalibration

[Table 3-75](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

**Table 3-75. DPLL\_IVA Recalibration Feature Parameters**

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_IVA[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[2] DPLL_IVA_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_A9[2] DPLL_IVA_RECAL_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_M3[2] DPLL_IVA_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_M3[2] DPLL_IVA_RECAL_EN

### 3.6.3.8.5 Spread Spectrum Clocking

[Table 3-76](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

**Table 3-76. DPLL\_IVA Spread-Spectrum Clocking Feature Parameters**

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_IVA[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_IVA[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_IVA[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_IVA[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_IVA[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_IVA[6:0] MODFREQDIV_MANTISSA

### 3.6.3.8.6 Output Power Down

[Table 3-77](#) lists the control bit fields for the output power down features of the DPLL. See [Section 3.6.3.3.6, DPLL Output Power-Down](#), for an explanation of the DPLL output power-down feature.

**Table 3-77. DPLL\_IVA Clock Output Power-down Parameters**

Parameter Name	Control/Status Bit Field
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_IVA[12] HSDIVIDER_CLKOUT1_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_IVA[12] HSDIVIDER_CLKOUT2_PWDN

### 3.6.3.9 DPLL\_USB Description

#### 3.6.3.9.1 Overview

Figure 3-46 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

**Figure 3-46. DPLL\_USB Overview**

prom-047

#### 3.6.3.9.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic PDLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-78 lists the clock synthesis parameters of the DPLL.

**Table 3-78. DPLL\_USB Clock Synthesis Parameters**

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_USB[19:8] DPLL_MULT
N	CM_CLKSEL_DPLL_USB[7:0] DPLL_DIV

Table 3-79 lists the clock output divider parameters of the DPLL.

**Table 3-79. DPLL\_USB Clock Output Parameters**

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_USB[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_USB[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_USB[7] DPLL_CLKOUT_DIVCHACK
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_USB[6:0] DPLL_CLKOUT_DIV

#### 3.6.3.9.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See Section 3.6.3.3.2, *Enable Control, Status and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Modes*, for an explanation of the DPLL operating modes, and associated control and status features.

Table 3-80 lists the operating modes supported by the DPLL.

**Table 3-80. DPLL\_USB Modes**

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Available	Not available	Available (Default)	Available	Not available	Available

Table 3-81 lists the control bit fields for the operating mode control of the DPLL.

**Table 3-81. DPLL\_USB Mode Control Parameters**

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_USB[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE

### 3.6.3.9.4 Spread Spectrum Clocking

Table 3-82 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

**Table 3-82. DPLL\_USB Spread-Spectrum Clocking Feature Parameters**

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_USB[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_USB[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_USB[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_USB[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_USB[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_USB[6:0] MODFREQDIV_MANTISSA

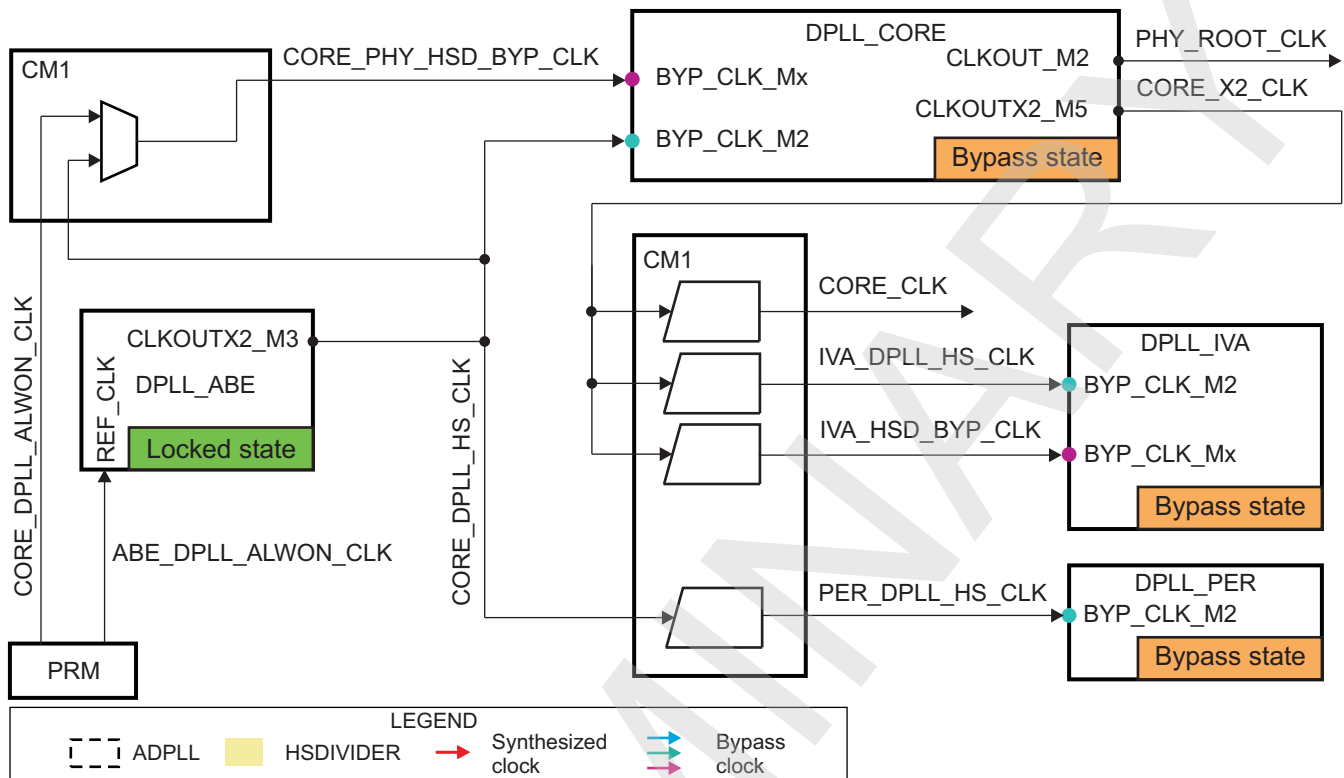

### 3.6.3.10 DPLLs Cascading

To reduce the device power consumption in certain low-power use cases of the device, the DPLLs in the device can be cascaded so that functional clock to a power domain is provided by a DPLL upstream without locking the DPLL associated with the domain. In such a case, the unlocked DPLLs can be kept in the low-power bypass mode shows the scheme for cascading DPLLs.

Figure 3-47 shows a generic scheme for cascading DPLLs.

Figure 3-47. DPLLs Cascading Overview

prom-049

The sequence of enabling the DPLL cascading is given below:

1. DPLL\_ABE is locked by software request. Other DPLLs down stream must not be moved to bypass mode before DPLL\_ABE is locked. This ensures that the output clocks of these DPLLs are not stopped when they switch to the DPLL\_ABE output clock.
2. Internal EMIF shadow registers are set to take PHY clock and DLL reference clock derived from DPLL\_ABE.
3. Bypass paths for DPLL\_IVA is set up by configuring the programmable dividers in CM1 responsible for providing the bypass clock. The setting is based upon the OPP requirements.
4. DPLL\_IVA is put into bypass mode by software (any of the bypass mode is allowed) and the output of the DPLL, if already enabled, switches from locked clock to bypass clock from DPLL\_CORE
5. DPLL\_PER is put into bypass mode as well by software, if required. The outputs of the DPLL, if enabled, switch to the divided clock of DPLL\_ABE CLKOUTX2\_M3.
6. DPLL\_CORE is set in bypass mode by configuring the bypass clocks input mux and the [CM\\_SHADOW\\_FREQ\\_CONFIG1\[10:8\]](#) DPLL\_CORE\_DPLL\_EN bit field to a bypass mode in the DVFS shadow register in CM1 and setting [CM\\_SHADOW\\_FREQ\\_CONFIG1\[0\]](#) FREQ\_UPDATE = 1 by software. This step triggers the handshake with EMIF to safely unlock the DPLL and move the output clock of DPLL\_CORE to CORE\_DPLL\_HS\_CLK. Ensure that the CORE\_CLK divider in CM1 is correctly programmed to handle the OPP needs of the CORE power domain before this step.
7. Software can then switch the L4\_WKUP interface clock from SYS\_CLK to ABE\_LP\_CLK to allow for deasserting of the SYS\_CLK request line to SCRM, if SYS\_CLK is not requested by any other dependency.

The sequence of disabling the DPLL cascading is given below:

1. Software switches the L4\_WKUP interface clock from ABE\_LP\_CLK to SYS\_CLK requesting the restart of SYS\_CLK by the SCRM, if not already present.
2. Software programs the EMIF internal shadow registers to prepare the switchback of EMIF interface from using DPLL\_ABE clock to DPLL\_CORE clock.
3. DPLL\_IVA bypass path is correctly set for the targeted DPLL\_CORE frequency by programming the

bypass dividers for the DPLL in CM1.

4. DPLL\_CORE is relocked using the DVFS shadow register in CM1. The PRCM module ensures that this step is executed with proper handshake with EMIF to allow for a frequency update on the EMIF interface.
5. Other DPLLs are locked as well if required, to fully exit from the DPLL cascading mode.
6. DPLL\_ABE might be forced into STOPMODE or bypass mode by software or may enter one of the auto modes if so programmed.

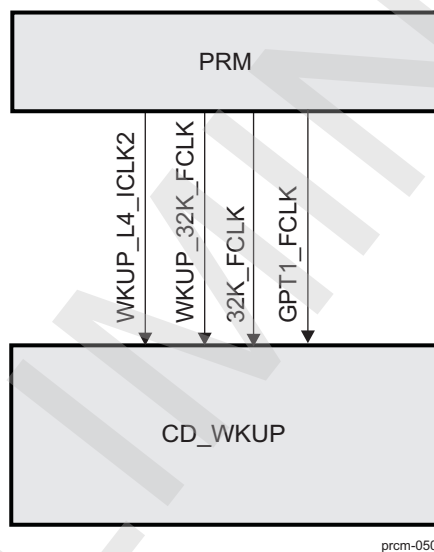

### 3.6.4 CD\_WKUP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.4.1 Overview

Figure 3-48 shows the overview of the clock domain.

**Figure 3-48. CD\_WKUP Overview**

#### 3.6.4.2 Clock Domain Modes

Table 3-83 lists the clock domain modes supported by the clock domain.

**Table 3-83. CD\_WKUP Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-84 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-84. CD\_WKUP Control and Status Parameters**

Parameter Name	Control/Status Bit Field
ABE_LP_CLK clock status	CM_WKUP_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK
WKUP_L4_ICLK2 clock status	CM_WKUP_CLKSTCTRL[12] CLKACTIVITY_WKUP_L4_ICLK2
SYS_CLK clock status	CM_WKUP_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
WKUP_32K_FCLK clock status	CM_WKUP_CLKSTCTRL[11] CLKACTIVITY_WKUP_32K_FCLK
Clock Domain State Transition Control	CM_WKUP_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.4.3 Clock Domain Dependency

CD\_WKUP has no static dependency or dynamic dependency with any other clock domain of the device.

#### 3.6.4.3.1 Wake-Up Dependency

Table 3-85 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-85. CD\_WKUP Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPIO1	CD_WKUP	CD_DSP	Always enabled	PM_WKUP_GPIO1_WKDEP[6] WKUPDEP_GPIO1_IRQ2_DSP	Read only
GPIO1	CD_WKUP	CD_CORTEXM3	Disabled	PM_WKUP_GPIO1_WKDEP[1] WKUPDEP_GPIO1_IRQ1_MPU_M3	Read/Write
GPIO1	CD_WKUP	CD_CORTEXA9	Disabled	PM_WKUP_GPIO1_WKDEP[0] WKUPDEP_GPIO1_IRQ1_MPU	Read/Write
KEYBOARD	CD_WKUP	CD_CORTEXA9	Always enabled	PM_WKUP_KEYBOARD_WKDEP[0] WKUPDEP_KEYBOARD_MPU	Read only
GPTIMER1	CD_WKUP	CD_CORTEXA9	Always enabled	PM_WKUP_GPTIMER1_WKDEP[0] WKUPDEP_TIMER1_MPU	Read only
WDTIMER2	CD_WKUP	CD_CORTEXM3	Disabled	PM_WKUP_WDTIMER2_WKDEP[1] WKUPDEP_WDT2_MPU_M3	Read/Write
WDTIMER2	CD_WKUP	CD_CORTEXA9	Disabled	PM_WKUP_WDTIMER2_WKDEP[0] WKUPDEP_WDT2_MPU	Read/Write

#### 3.6.4.4 Clock Domain Module Attributes

Table 3-86 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-86. CD\_WKUP Modules Clocks Association**

Module	Clock	Clock Type
SYSCONFIG_PADCONF_WKUP	WKUP_L4_ICLK2	Functional
BANDGAP	WKUP_32K_FCLK	Functional
SYSCONFIG_GENERAL_WKUP	WKUP_L4_ICLK2	Functional
GPIO1	WKUP_L4_ICLK2	Interface
	WKUP_32K_FCLK	Functional
Keyboard	WKUP_L4_ICLK2	Interface
	WKUP_32K_FCLK	Functional
SAR_RAM	WKUP_L4_ICLK2	Interface
32KTIMER	32K_FCLK	Functional
	WKUP_L4_ICLK2	Interface
GPTIMER1	GPT1_FCLK	Functional
	WKUP_L4_ICLK2	Interface

**Table 3-86. CD\_WKUP Modules Clocks Association (continued)**

Module	Clock	Clock Type
WDTIMER2	WKUP_L4_ICLK2	Interface
	WKUP_32K_FCLK	Functional
L4_WKUP interconnect	WKUP_L4_ICLK2	Interface

Table 3-87 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-87. CD\_WKUP Modules Wake-Up Request**

Module	Wake-Up Feature
SYSCTRL_PADCONF_WKUP	None
BANDGAP	None
SYSCTRL_GENERAL_WKUP	None
GPIO1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)
Keyboard	Slave wake-up request (MPU_A9 -IRQ)
SAR_RAM	None
32KTIMER	None
GPTIMER1	Slave wake-up request (MPU_A9 -IRQ)
WDTIMER2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
L4_WKUP interconnect	None

Table 3-88 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-88. CD\_WKUP Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
GPIO1	Slave	CM_WKUP_GPIO1_CLKCTRL [17:16] IDLEST	Idle status
KEYBOARD	Slave	CM_WKUP_KEYBOARD_CLKCTRL [17:16] IDLEST	Idle status
SAR_RAM	Slave	CM_WKUP_SARRAM_CLKCTRL [17:16] IDLEST	Idle status
32KTIMER	Slave	CM_WKUP_32KTIMER_CLKCTRL [17:16] IDLEST	Idle status
GPTIMER1	Slave	CM_WKUP_GPTIMER1_CLKCTRL [17:16] IDLEST	Idle status
WDTIMER2	Slave	CM_WKUP_WDTIMER2_CLKCTRL [17:16] IDLEST	Idle status
L4_WKUP interconnect	Slave	CM_WKUP_L4WKUP_CLKCTRL [17:16] IDLEST	Idle status

Table 3-89 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

**Table 3-89. CD\_WKUP Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPIO1	Available	Available	N/A	CM_WKUP_GPIO1_CLKCTRL [1:0] MODULEMODE	Read/Write
KEYBOARD	Available	N/A	Available	CM_WKUP_KEYBOARD_CLKCTRL [1:0] MODULEMODE	Read/Write
SAR_RAM	N/A	Available	N/A	CM_WKUP_SARRAM_CLKCTRL [1:0] MODULEMODE	Read only

**Table 3-89. CD\_WKUP Modules Slave Clock-Management Modes and Control (continued)**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
32KTIMER	N/A	Available	N/A	CM_WKUP_32KTIMER_CLKCTRL[1:0] MODULEMODE	Read only
GPTIMER1	Available	N/A	Available	CM_WKUP_GPTIMER1_CLKCTRL[1:0] MODULEMODE	Read/Write
WDTIMER2	Available	N/A	Available	CM_WKUP_WDTIMER2_CLKCTRL[1:0] MODULEMODE	Read/Write
L4_WKUP interconnect	N/A	Available	N/A	CM_WKUP_L4WKUP_CLKCTRL[1:0] MODULEMODE	Read only

### 3.6.5 CD\_DSP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.5.1 Overview

Figure 3-49 shows the overview of the clock domain.

**Figure 3-49. CD\_DSP Overview**

#### 3.6.5.2 Clock Domain Modes

Table 3-90 lists the clock domain modes supported by the clock domain.

**Table 3-90. CD\_DSP Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-91 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-91. CD\_DSP Control and Status Parameters**

Parameter Name	Control/Status Bit Field
DSP_ROOT_CLK clock status	CM_DSP_CLKSTCTRL[8] CLKACTIVITY_DSP_ROOT_CLK
Clock Domain State Transition Control	CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.5.3 Clock Domain Dependency

CD\_DSP has no module wake-up dependency with any other clock domain of the device.

#### 3.6.5.3.1 Static Dependency

Table 3-92 lists the static dependency of the clock domain with respect to other clock domains of the device.

**Table 3-92. CD\_DSP Static Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_DSP_STATICDEP[3] ABE_STATDEP	Read/Write
CD_CAM	Always disabled	CM_DSP_STATICDEP[9] ISS_STATDEP	Read only
CD_IVAHD	Disabled	CM_DSP_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_DSP_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Disabled	CM_DSP_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_L3_INIT	Disabled	CM_DSP_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Disabled	CM_DSP_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_DSP_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_EMIF	Disabled	CM_DSP_STATICDEP[4] MEMIF_STATDEP	Read/Write

#### 3.6.5.3.2 Dynamic Dependency

Table 3-93 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-93. CD\_DSP Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_DSP_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_IVAHD	Always enabled	CM_DSP_DYNAMICDEP[2] IVAHD_DYNDEP	Read only
CD_L3_1	Always enabled	CM_DSP_DYNAMICDEP[5] L3_1_DYNDEP	Read only

### 3.6.5.4 Clock Domain Module Attributes

Table 3-94 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-94. CD\_DSP Modules Clocks Association**

Module	Clock	Clock Type
DSP	DSP_ROOT_CLK	Interface and functional

Table 3-95 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-95. CD\_DSP Modules Wake-Up Request**

Module	Wake-Up Feature
DSP	Master wake-up request

Table 3-96 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-96. CD\_DSP Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
DSP	Master/Slave	CM_DSP_DSP_CLKCTRL[18] STBYST	Standby status
		CM_DSP_DSP_CLKCTRL[17:16] IDLEST	Idle status

Table 3-97 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-97. CD\_DSP Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSP	Available	Available	N/A	CM_DSP_DSP_CLKCTRL[1:0] MODULEMODE	Read/Write

### 3.6.6 CD\_STD\_EFUSE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.6.1 Overview

Figure 3-50 shows the overview of the clock domain.

**Figure 3-50. CD\_STD\_EFUSE Overview**

CD\_STD\_EFUSE is hardware-controlled by the PRCM module and has no software control or status bit fields. Similarly, it has no static, dynamic and wake-up dependency with respect to other clock domains of the device

### 3.6.6.2 Clock Domain Module Attributes

The STD\_EFUSE module of the clock domain is automatically controlled by the PRCM module hardware and has no software configurable module mode control or status bit fields.

Table 3-98 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-98. CD\_STD\_EFUSE Modules Clocks Association**

Module	Clock	Clock Type
STD_EFUSE	STDEFUSE_SYS_CLK	Functional

Table 3-99 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-99. CD\_STD\_EFUSE Modules Wake-Up Request**

Module	Wake-Up Feature
STD_EFUSE	None

### 3.6.7 CD\_CORTEXA9 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.7.1 Overview

Figure 3-51 shows the overview of the clock domain.

**Figure 3-51. CD\_CORTEXA9 Overview**

#### 3.6.7.2 Clock Domain Modes

Table 3-100 lists the clock domain modes supported by the clock domain.

**Table 3-100. CD\_CORTEXA9 Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-101 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-101. CD\_CORTEXA9 Control and Status Parameters**

Parameter Name	Control/Status Bit Field
MPU_DPLL_CLK clock status	CM_MPU_CLKSTCTRL[9] CLKACTIVITY_MPU_DPLL_CLK
Clock Domain State Transition Control	CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.7.3 Clock Domain Dependency

CD\_CORTEXA9 has no module wake-up dependency with any other clock domain of the device.

#### 3.6.7.3.1 Static Dependency

Table 3-102 lists the static dependency of the clock domain with respect to other clock domains of the device.

**Table 3-102. CD\_CORTEXA9 Static Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_MPU_STATICDEP[3] ABE_STATDEP	Read/Write
CD_C2C	Always disabled	CM_MPU_STATICDEP[18] C2C_STATDEP	Read only
CD_DSS	Disabled	CM_MPU_STATICDEP[8] DSS_STATDEP	Read/Write
CD_CORTEXM3	Disabled	CM_MPU_STATICDEP[0] MPU_M3_STATDEP	Read/Write
CD_SGX	Disabled	CM_MPU_STATICDEP[10] SGX_STATDEP	Read/Write
CD_CAM	Always disabled	CM_MPU_STATICDEP[9] ISS_STATDEP	Read only
CD_IVAHD	Disabled	CM_MPU_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Enabled	CM_MPU_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Enabled	CM_MPU_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_L3_INIT	Enabled	CM_MPU_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Enabled	CM_MPU_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Enabled	CM_MPU_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_EMIF	Enabled	CM_MPU_STATICDEP[4] MEMIF_STATDEP	Read/Write
CD_DMA	Always disabled	CM_MPU_STATICDEP[11] SDMA_STATDEP	Read only
CD_DSP	Disabled	CM_MPU_STATICDEP[1] DSP_STATDEP	Read/Write

#### 3.6.7.3.2 Dynamic Dependency

Table 3-103 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-103. CD\_CORTEXA9 Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_MPU_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_L3_1	Always enabled	CM_MPU_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_EMIF	Always enabled	CM_MPU_DYNAMICDEP[4] MEMIF_DYNDEP	Read only

### 3.6.7.4 Clock Domain Module Attributes

Table 3-104 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-104. CD\_CORTEXA9 Modules Clocks Association**

Module	Clock	Clock Type
CORTEXA9	MPU_DPLL_CLK	Interface and Functional

Table 3-105 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-105. CD\_CORTEXA9 Modules Wake-Up Request**

Module	Wake-Up Feature
CORTEXA9	Master wake-up request

Table 3-106 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-106. CD\_CORTEXA9 Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
CORTEXA9	Master/Slave	CM_MPU_MPU_CLKCTRL[18] STBYST	Standby status
		CM_MPU_MPU_CLKCTRL[17: 16] IDLEST	Idle status

Table 3-107 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-107. CD\_CORTEXA9 Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
CORTEXA9	N/A	Available	N/A	CM_MPU_MPU_CL KCTRL[1:0] MODULEMODE	Read only

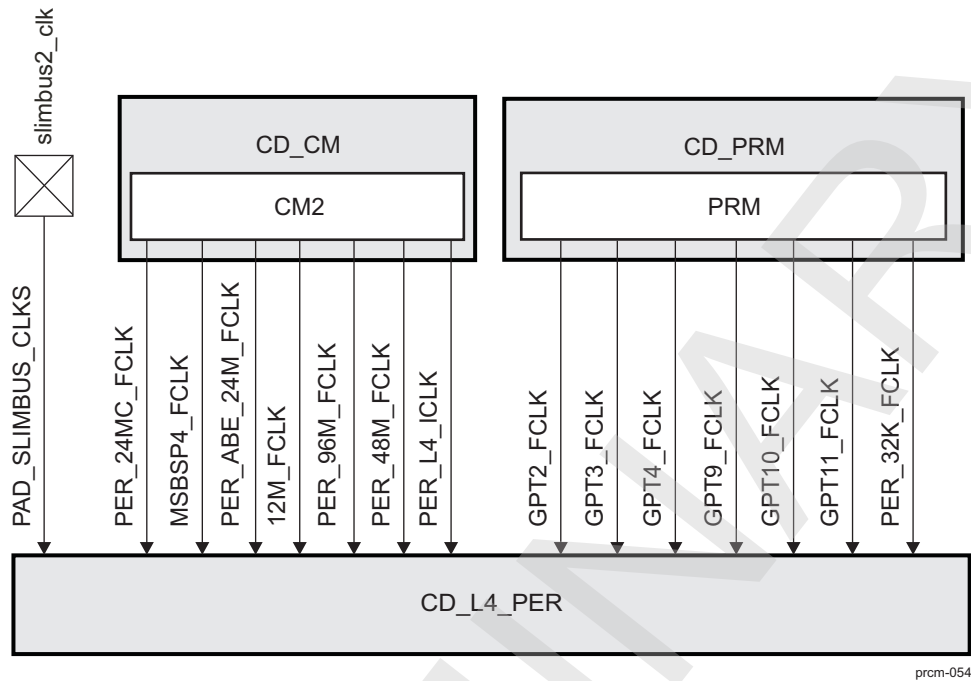

## 3.6.8 CD\_L4\_PER Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

### 3.6.8.1 Overview

Figure 3-52 shows the overview of the clock domain.

Figure 3-52. CD\_L4\_PER Overview

3.6.8.2 Clock Domain Modes

Table 3-108 lists the clock domain modes supported by the clock domain.

Table 3-108. CD\_L4\_PER Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-109 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-109. CD\_L4\_PER Control and Status Parameters

Parameter Name	Control/Status Bit Field
GPT10_FCLK clock status	CM_L4PER_CLKSTCTRL[9] CLKACTIVITY_GPT10_FCLK
GPT11_FCLK clock status	CM_L4PER_CLKSTCTRL[10] CLKACTIVITY_GPT11_FCLK
GPT2_FCLK clock status	CM_L4PER_CLKSTCTRL[11] CLKACTIVITY_GPT2_FCLK
GPT3_FCLK clock status	CM_L4PER_CLKSTCTRL[12] CLKACTIVITY_GPT3_FCLK
GPT4_FCLK clock status	CM_L4PER_CLKSTCTRL[13] CLKACTIVITY_GPT4_FCLK
GPT9_FCLK clock status	CM_L4PER_CLKSTCTRL[14] CLKACTIVITY_GPT9_FCLK
12M_FCLK clock status	CM_L4PER_CLKSTCTRL[15] CLKACTIVITY_12M_FCLK_FCLK
PER_L4_ICLK clock status	CM_L4PER_CLKSTCTRL[8] CLKACTIVITY_L4_PER_ICLK
PER_24MC_FCLK clock status	CM_L4PER_CLKSTCTRL[16] CLKACTIVITY_PER_24MC_FCLK
PER_32K_FCLK clock status	CM_L4PER_CLKSTCTRL[17] CLKACTIVITY_PER_32K_FCLK
PER_48M_FCLK clock status	CM_L4PER_CLKSTCTRL[18] CLKACTIVITY_PER_48M_FCLK
PER_96M_FCLK clock status	CM_L4PER_CLKSTCTRL[19] CLKACTIVITY_PER_96M_FCLK
PER_ABE_24M_FCLK clock status	CM_L4PER_CLKSTCTRL[25] CLKACTIVITY_PER_ABE_24M_FCLK
MCBSP4_FCLK clock status	CM_L4PER_CLKSTCTRL[22] CLKACTIVITY_PER_MCBSP4_FCLK
Clock Domain State Transition Control	CM_L4PER_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.8.3 Clock Domain Dependency

CD\_L4\_PER has no static dependency with any other clock domain of the device.

#### 3.6.8.3.1 Dynamic Dependency

Table 3-110 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-110. CD\_L4\_PER Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_DSS	Always enabled	CM_L4PER_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_L3_INIT	Always enabled	CM_L4PER_DYNAMICDEP[7] L3_INIT_DYNDEP	Read only

#### 3.6.8.3.2 Wake-Up Dependency

Table 3-111 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-111. CD\_L4\_PER Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPTIMER10	CD_L4_PER	CD_CORTEXA9	Always enabled	PM_L4PER_GPTIM ER10_WKDEP[0] WKUPDEP_DMTIM ER10_MPU	Read only
GPTIMER11	CD_L4_PER	CD_CORTEXM3	Disabled	PM_L4PER_GPTIM ER11_WKDEP[1] WKUPDEP_DMTIM ER11_MPU_M3	Read/Write
GPTIMER11	CD_L4_PER	CD_CORTEXA9	Disabled	PM_L4PER_GPTIM ER11_WKDEP[0] WKUPDEP_DMTIM ER11_MPU	Read/Write

L4_PER interconnect	PER_L4_ICLK	Interface
MCBSP4	PER_L4_ICLK	Interface
	MCBSP4_FCLK	Functional
MCSPI1	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
MCSPI2	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
MCSPI3	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
MCSPI4	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional

**Table 3-112. CD\_L4\_PER Modules Clocks Association (continued)**

Module	Clock	Clock Type
HSMMC3	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
HSMMC4	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
HSMMC5	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
SLIMBUS2	PER_L4_ICLK	Interface
	PAD_SLIMBUS_CLKS	Functional
	PER_24MC_FCLK	Functional
	PER_ABE_24M_FCLK	Functional
UART1	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
UART2	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
UART3	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
UART4	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional

Table 3-113 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-113. CD\_L4\_PER Modules Wake-Up Request**

Module	Wake-Up Feature
GPTIMER10	Slave wake-up request (MPU_A9 -IRQ)
GPTIMER11	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER2	Slave wake-up request (MPU_A9 -IRQ)
GPTIMER3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER9	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
ELM	None
GPIO2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)
GPIO3	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPIO4	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPIO5	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPIO6	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
HDQ	None
I2C1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
L4_PER interconnect	None
MCBSP4	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)

**Table 3-113. CD\_L4\_PER Modules Wake-Up Request (continued)**

Module	Wake-Up Feature
MCSP11	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
MCSP12	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
MCSP13	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
MCSP14	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
HSMMC3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
HSMMC4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
HSMMC5	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
SLIMBUS2	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
UART1	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
UART2	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
UART3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
UART4	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)

Table 3-114 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-114. CD\_L4\_PER Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
GPTIMER10	Slave	CM_L4PER_GPTIMER10_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER11	Slave	CM_L4PER_GPTIMER11_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER2	Slave	CM_L4PER_GPTIMER2_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER3	Slave	CM_L4PER_GPTIMER3_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER4	Slave	CM_L4PER_GPTIMER4_CLK_CTRL[17:16] IDLEST	Idle status

### 3.6.9 CD\_L3\_INIT Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.9.1 Overview

Figure 3-53 shows the overview of the clock domain.

Figure 3-53. CD\_L3\_INIT Overview

### 3.6.9.2 Clock Domain Modes

Table 3-116 lists the clock domain modes supported by the clock domain.

Table 3-116. CD\_L3\_INIT Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-117 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-117. CD\_L3\_INIT Control and Status Parameters

Parameter Name	Control/Status Bit Field
HSIC_P1_480M_FCLK clock status	CM_L3INIT_CLKSTCTRL[20] CLKACTIVITY_HSIC_P1_480M_FCLK
HSIC_P1_FCLK clock status	CM_L3INIT_CLKSTCTRL[26] CLKACTIVITY_HSIC_P1_FCLK
HSIC_P2_480M_FCLK clock status	CM_L3INIT_CLKSTCTRL[21] CLKACTIVITY_HSIC_P2_480M_FCLK
HSIC_P2_FCLK clock status	CM_L3INIT_CLKSTCTRL[27] CLKACTIVITY_HSIC_P2_FCLK
INIT_32K_FCLK clock status	CM_L3INIT_CLKSTCTRL[31] CLKACTIVITY_INIT_32K_FCLK
INIT_48MC_FCLK clock status	CM_L3INIT_CLKSTCTRL[12] CLKACTIVITY_INIT_48MC_FCLK
INIT_48M_FCLK clock status	CM_L3INIT_CLKSTCTRL[13] CLKACTIVITY_INIT_48M_FCLK
INIT_60M_P1_FCLK clock status	CM_L3INIT_CLKSTCTRL[28] CLKACTIVITY_INIT_60M_P1_FCLK
INIT_60M_P2_FCLK clock status	CM_L3INIT_CLKSTCTRL[29] CLKACTIVITY_INIT_60M_P2_FCLK
INIT_HSI_FCLK clock status	CM_L3INIT_CLKSTCTRL[16] CLKACTIVITY_INIT_HSI_FCLK
MMC1_FCLK clock status	CM_L3INIT_CLKSTCTRL[17] CLKACTIVITY_INIT_HSMMC1_FCLK
MMC2_FCLK clock status	CM_L3INIT_CLKSTCTRL[18] CLKACTIVITY_INIT_HSMMC2_FCLK
INIT_L3_ICLK clock status	CM_L3INIT_CLKSTCTRL[8] CLKACTIVITY_INIT_L3_ICLK

**Table 3-117. CD\_L3\_INIT Control and Status Parameters (continued)**

Parameter Name	Control/Status Bit Field
INIT_L4_ICLK clock status	CM_L3INIT_CLKSTCTRL[9] CLKACTIVITY_INIT_L4_ICLK
TLL_CH0_FCLK clock status	CM_L3INIT_CLKSTCTRL[22] CLKACTIVITY_TLL_CH0_FCLK
TLL_CH1_FCLK clock status	CM_L3INIT_CLKSTCTRL[23] CLKACTIVITY_TLL_CH1_FCLK
TLL_CH2_FCLK clock status	CM_L3INIT_CLKSTCTRL[24] CLKACTIVITY_TLL_CH2_FCLK
UTMI_ROOT_FCLK clock status	CM_L3INIT_CLKSTCTRL[25] CLKACTIVITY_UTMI_ROOT_FCLK
Clock Domain State Transition Control	CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.9.3 Clock Domain Dependency

#### 3.6.9.3.1 Static Dependency

Table 3-118 lists the static dependency of the clock domain with respect to other clock domains of the device.

**Table 3-118. CD\_L3\_INIT Static Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_L3INIT_STATICDEP[3] ABE_STATDEP	Read/Write
CD_IVAHD	Disabled	CM_L3INIT_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Always enabled	CM_L3INIT_STATICDEP[5] L3_1_STATDEP	Read only
CD_L3_2	Always enabled	CM_L3INIT_STATICDEP[6] L3_2_STATDEP	Read only
CD_L4_CFG	Disabled	CM_L3INIT_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_L3INIT_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_EMIF	Disabled	CM_L3INIT_STATICDEP[4] MEMIF_STATDEP	Read/Write

#### 3.6.9.3.2 Dynamic Dependency

Table 3-119 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-119. CD\_L3\_INIT Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always disabled	CM_L3INIT_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_L3_2	Always disabled	CM_L3INIT_DYNAMICDEP[6] L3_2_DYNDEP	Read only

#### 3.6.9.3.3 Wake-Up Dependency

Table 3-120 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-120. CD\_L3\_INIT Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
HSI	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSI_WKDEP[8] WKUPDEP_WGM_HSI_WAKE_MPU	Read/Write
HSI	CD_L3_INIT	CD_DSP	Always enabled	PM_L3INIT_HSI_WKDEP[6] WKUPDEP_HSI_DSP_DSP	Read only
HSI	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSI_WKDEP[1] WKUPDEP_HSI_MCU_MPU_M3	Read/Write
HSI	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSI_WKDEP[0] WKUPDEP_HSI_MCU_MPU	Read/Write
HSMMC1	CD_L3_INIT	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_L3INIT_MMC1_WKDEP[3] WKUPDEP_MMC1_SDMA	Read/Write
HSMMC1	CD_L3_INIT	CD_DSP	Disabled	PM_L3INIT_MMC1_WKDEP[2] WKUPDEP_MMC1_DSP	Read/Write
HSMMC1	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_MMC1_WKDEP[1] WKUPDEP_MMC1_MPU_M3	Read/Write
HSMMC1	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_MMC1_WKDEP[0] WKUPDEP_MMC1_MPU	Read/Write
HSMMC2	CD_L3_INIT	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_L3INIT_MMC2_WKDEP[3] WKUPDEP_MMC2_SDMA	Read/Write
HSMMC2	CD_L3_INIT	CD_DSP	Disabled	PM_L3INIT_MMC2_WKDEP[2] WKUPDEP_MMC2_DSP	Read/Write
HSMMC2	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_MMC2_WKDEP[1] WKUPDEP_MMC2_MPU_M3	Read/Write
HSMMC2	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_MMC2_WKDEP[0] WKUPDEP_MMC2_MPU	Read/Write
FSUSB	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_FSUSB_WKDEP[1] WKUPDEP_FSUSB_MPU_M3	Read/Write
FSUSB	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_FSUSB_WKDEP[0] WKUPDEP_FSUSB_MPU	Read/Write
HSUSBHOST	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB_HOST_WKDEP[1] WKUPDEP_HSUSB_HOST_MPU_M3	Read/Write

**Table 3-120. CD\_L3\_INIT Wake-Up Dependency Association Parameters (continued)**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
HSUSBHOST	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB HOST_WKDEP[0] WKUPDEP_HSUSB HOST_MPU	Read/Write
HSUSBOTG	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB OTG_WKDEP[1] WKUPDEP_HSUSB OTG_MPU_M3	Read/Write
HSUSBOTG	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB OTG_WKDEP[0] WKUPDEP_HSUSB OTG_MPU	Read/Write
HSUSBTLL	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB TLL_WKDEP[1] WKUPDEP_HSUSB TLL_MPU_M3	Read/Write
HSUSBTLL	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB TLL_WKDEP[0] WKUPDEP_HSUSB TLL_MPU	Read/Write

### 3.6.9.4 Clock Domain Module Attributes

Table 3-121 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-121. CD\_L3\_INIT Modules Clocks Association**

Module	Clock	Clock Type
HSI	INIT_HSI_FCLK	Interface and functional
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
P1500	INIT_L3_ICLK	Interface and functional
	INIT_L4_ICLK	Interface
HSMC1	MMC1_FCLK	Functional
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
HSMC2	MMC2_FCLK	Functional
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
USBPHY	INIT_32K_FCLK	Functional
	INIT_48M_FCLK	Functional
	INIT_L4_ICLK	Interface
	INIT_960M_FCLK	Functional
FSUSB	INIT_48MC_FCLK	Functional
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
HSUSBHOST	HSIC_P1_480M_FCLK	Functional
	HSIC_P1_FCLK	Functional
	HSIC_P2_480M_FCLK	Functional
	HSIC_P2_FCLK	Functional
	INIT_48MC_FCLK	Functional (mandatory)
	INIT_48MC_FCLK	Functional (optional)

**Table 3-121. CD\_L3\_INIT Modules Clocks Association (continued)**

Module	Clock	Clock Type
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
	UTMI_P1_FCLK	Functional
	UTMI_P2_FCLK	Functional
	UTMI_ROOT_FCLK	Functional
HSUSBOTG	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
	OTG_60M_FCLK	Functional
HSUSBTLL	INIT_L4_ICLK	Interface
	TLL_CH0_FCLK	Functional
	TLL_CH1_FCLK	Functional
	TLL_CH2_FCLK	Functional

Table 3-122 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-122. CD\_L3\_INIT Modules Wake-Up Request**

Module	Wake-Up Feature
HSI	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)/Master wake-up request
HSMMC1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
HSMMC2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
USBPHY	None
FSUSB	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)/Master wake-up request
HSUSBHOST	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
HSUSBOTG	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
HSUSBTLL	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)

Table 3-123 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-123. CD\_L3\_INIT Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
HSI	Slave/Master	CM_L3INIT_HSI_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSI_CLKCTRL[17:16] IDLEST	Idle status
P1500	Slave/Master	CM_L3INIT_P1500_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSI_CLKCTRL[17:16] IDLEST	Idle status
HSMMC1	Master/Slave	CM_L3INIT_HSMMC1_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSMMC1_CLKCTRL[17:16] IDLEST	Idle status
HSMMC2	Master/Slave	CM_L3INIT_HSMMC2_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSMMC2_CLKCTRL[17:16] IDLEST	Idle status

**Table 3-123. CD\_L3\_INIT Modules Clock-Management Modes and Control (continued)**

Module	Clock-Management Protocol	Status Bit Field	Role
USBPHY	Slave	CM_L3INIT_USBPHY_CLKCTRL[17:16] IDLEST	Idle status
FSUSB	Slave/Master	CM_L3INIT_FSUSB_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_FSUSB_CLKCTRL[17:16] IDLEST	Idle status
HSUSBHOST	Slave/Master	CM_L3INIT_HSUSBHOST_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSUSBHOST_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[18] STBYST	Standby status
		CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
HSUSBOTG	Slave/Master	CM_L3INIT_HSUSBOTG_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSUSBOTG_CLKCTRL[17:16] IDLEST	Idle status
HSUSBTLL	Slave	CM_L3INIT_HSUSBTLL_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INIT_HSUSBTLL_CLKCTRL_RESTORE[17:16] IDLEST	Idle status

Table 3-124 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-124. CD\_L3\_INIT Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
HSI	Available	Available	N/A	CM_L3INIT_HSI_CLKCTRL[1:0] MODULEMODE	Read/Write
P1500	N/A	Available	N/A	CM_L3INIT_P1500_CLKCTRL[1:0] MODULEMODE	Read
HSMMC1	Available	N/A	Available	CM_L3INIT_HSMMC1_CLKCTRL[1:0] MODULEMODE	Read/Write
HSMMC2	Available	N/A	Available	CM_L3INIT_HSMMC2_CLKCTRL[1:0] MODULEMODE	Read/Write
USBPHY	Available	Available	N/A	CM_L3INIT_USBPHY_CLKCTRL[1:0] MODULEMODE	Read/Write
FSUSB	Available	N/A	Available	CM_L3INIT_FSUSB_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBHOST	Available	N/A	Available	CM_L3INIT_HSUSBHOST_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBOTG	Available	Available	N/A	CM_L3INIT_HSUSBOTG_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBTLL	Available	Available	N/A	CM_L3INIT_HSUSBTLL_CLKCTRL[1:0] MODULEMODE	Read/Write

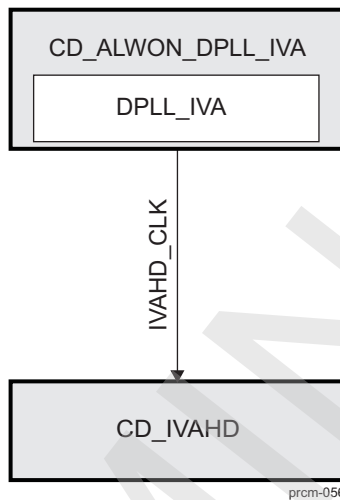

### 3.6.10 CD\_IVAHD Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.10.1 Overview

Figure 3-54 shows the overview of the clock domain.

Figure 3-54. CD\_IVAHD Overview

#### 3.6.10.2 Clock Domain Modes

Table 3-125 lists the clock domain modes supported by the clock domain.

Table 3-125. CD\_IVAHD Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-126 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-126. CD\_IVAHD Control and Status Parameters

Parameter Name	Control/Status Bit Field
IVAHD_ROOT_CLK clock status	CM_IVAHD_CLKSTCTRL[8] CLKACTIVITY_IVAHD_CLK
Clock Domain State Transition Control	CM_IVAHD_CLKSTCTRL[1:0] CLKTRCTRL

#### 3.6.10.3 Clock Domain Dependency

CD\_IVAHD has no module wake-up dependency with any other clock domain of the device

##### 3.6.10.3.1 Static Dependency

Table 3-127 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-127. CD\_IVAHD Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Disabled	CM_IVAHD_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_IVAHD_STATICDEP[6] L3_2_STATDEP	Read only

**Table 3-127. CD\_IVAHD Static Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_EMIF	Disabled	CM_IVAHD_STATICDEP[4] MEMIF_STATDEP	Read/Write

### 3.6.10.3.2 Dynamic Dependency

Table 3-128 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-128. CD\_IVAHD Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_IVAHD_DYNAMICDEP[6] L3_2_DYNDEP	Read only

### 3.6.10.4 Clock Domain Module Attributes

Table 3-129 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-129. CD\_IVAHD Modules Clocks Association**

Module	Clock	Clock Type
IVAHD	IVAHD_ROOT_CLK	Interface and Functional
SL2	IVAHD_ROOT_CLK	Interface

Table 3-130 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-130. CD\_IVAHD Modules Wake-Up Request**

Module	Wake-Up Feature
IVAHD	None
SL2	None

Table 3-131 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-131. CD\_IVAHD Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
IVAHD	Master/Slave	CM_IVAHD_IVAHD_CLKCTRL [18] STBYST	Standby status
		CM_IVAHD_IVAHD_CLKCTRL [17:16] IDLEST	Idle status
SL2	Slave	CM_IVAHD_SL2_CLKCTRL[17 :16] IDLEST	Idle status

Table 3-132 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-132. CD\_IVAHD Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IVAHD	Available	Available	N/A	CM_IVAHD_IVAHD_CLKCTRL[1:0] MODULEMODE	Read/Write
SL2	Available	Available	N/A	CM_IVAHD_SL2_CLKCTRL[1:0] MODULEMODE	Read/Write

### 3.6.11 CD\_SGX Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.11.1 Overview

Figure 3-55 shows the overview of the clock domain.

Figure 3-55. CD\_SGX Overview

#### 3.6.11.2 Clock Domain Modes

Table 3-133 lists the clock domain modes supported by the clock domain.

Table 3-133. CD\_SGX Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-134 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-134. CD\_SGX Control and Status Parameters

Parameter Name	Control/Status Bit Field
SGX_L3_ICLK clock status	CM_SGX_CLKSTCTRL[8] CLKACTIVITY_SGX_L3_ICLK
SGX_FCLK clock status	CM_SGX_CLKSTCTRL[9] CLKACTIVITY_SGX_FCLK
Clock Domain State Transition Control	CM_SGX_CLKSTCTRL[1:0] CLKTRCTRL

#### 3.6.11.3 Clock Domain Dependency

CD\_SGX has no module wake-up dependency with any other clock domain of the device.

##### 3.6.11.3.1 Static Dependency

Table 3-135 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-135. CD\_SGX Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_SGX_STATICDEP[2] IVAHD_STATDEP	Read/Write

**Table 3-135. CD\_SGX Static Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Disabled	CM_SGX_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_SGX_STATICDEP[6] L3_2_STATDEP	Read only
CD_EMIF	Disabled	CM_SGX_STATICDEP[4] MEMIF_STATDEP	Read/Write

### 3.6.11.3.2 Dynamic Dependency

Table 3-136 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-136. CD\_SGX Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_SGX_DYNAMICDEP[6] L3_2_DYNDEP	Read only

### 3.6.11.4 Clock Domain Module Attributes

Table 3-137 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-137. CD\_SGX Modules Clocks Association**

Module	Clock	Clock Type
SGX	SGX_L3_ICLK	Interface
	SGX_FCLK	Functional

Table 3-138 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-138. CD\_SGX Modules Wake-Up Request**

Module	Wake-Up Feature
SGX	None

Table 3-139 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-139. CD\_SGX Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
SGX	Master/Slave	CM_SGX_SGX_CLKCTRL[18] STBYST	Standby status
		CM_SGX_SGX_CLKCTRL[17: 16] IDLEST	Idle status

Table 3-140 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-140. CD\_SGX Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SGX	Available	N/A	Available	CM_SGX_SGX_CL KCTRL[1:0] MODULEMODE	Read/Write

### 3.6.12 CD\_EMU Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.12.1 Overview

Figure 3-56 shows the overview of the clock domain.

Figure 3-56. CD\_EMU Overview

Table 3-141 lists controls for clock dividers or muxes in the clock domain.

Table 3-141. CD\_EMU Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Divider STM_CLK	CM_EMU_DEBUGSS_CLKCTRL[29:27] CLKSEL_PMD_STM_CLK
Divider TRACE_CLK	CM_EMU_DEBUGSS_CLKCTRL[26:24] CLKSEL_PMD_TRACE_CLK

#### 3.6.12.2 Clock Domain Modes

Table 3-142 lists the clock domain modes supported by the clock domain.

**Table 3-142. CD\_EMU Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Available	Available

Table 3-143 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-143. CD\_EMU Control and Status Parameters**

Parameter Name	Control/Status Bit Field
CORE_DPLL_EMU_CLK clock status	CM_EMU_CLKSTCTRL[9] CLKACTIVITY_CORE_DPLL_EMU_CLK
EMU_SYS_CLK clock status	CM_EMU_CLKSTCTRL[8] CLKACTIVITY_EMU_SYS_CLK
Clock Domain State Transition Control	CM_EMU_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.12.3 Clock Domain Dependency

CD\_EMU has no static or module wake-up dependency with any other clock domain of the device.

#### 3.6.12.3.1 Dynamic Dependency

Table 3-144 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-144. CD\_EMU Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always enabled	CM_EMU_DYNAMICDEP[6] L3_2_DYNDEP	Read only

### 3.6.12.4 Clock Domain Module Attributes

Table 3-145 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-145. CD\_EMU Modules Clocks Association**

Module	Clock	Clock Type
DEBUG	DBG_CLK	Interface
	EMU_SYS_CLK	Interface and Functional
	STM_CLK	Interface and Functional
	TRACE_CLK	Interface and Functional

Table 3-146 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-146. CD\_EMU Modules Wake-Up Request**

Module	Wake-Up Feature
DEBUG	Master wake-up request

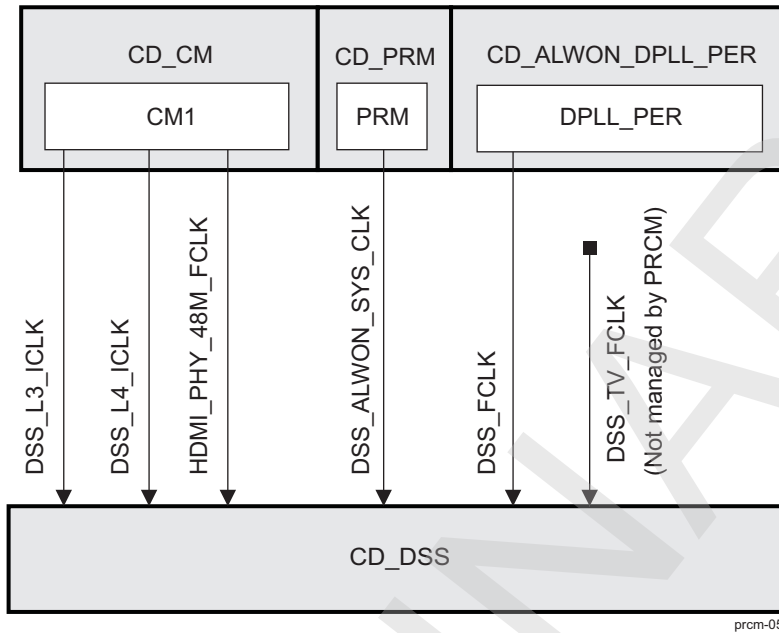

### 3.6.13 CD\_DSS Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.13.1 Overview

Figure 3-57 shows the overview of the clock domain.

Figure 3-57. CD\_DSS Overview

### 3.6.13.2 Clock Domain Modes

Table 3-147 lists the clock domain modes supported by the clock domain.

Table 3-147. CD\_DSS Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-148 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-148. CD\_DSS Control and Status Parameters

Parameter Name	Control/Status Bit Field
DSS_ALWON_SYS_CLK clock status	CM_DSS_CLKSTCTRL[10] CLKACTIVITY_DSS_ALWON_SYS_CLK
DSS_FCLK clock status	CM_DSS_CLKSTCTRL[9] CLKACTIVITY_DSS_FCLK
HDMI_PHY_48M_FCLK clock status	CM_DSS_CLKSTCTRL[11] CLKACTIVITY_HDMI_PHY_48M_FCLK
DSS_L3_ICLK clock status	CM_DSS_CLKSTCTRL[8] CLKACTIVITY_DSS_L3_ICLK
Clock Domain State Transition Control	CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.13.3 Clock Domain Dependency

#### 3.6.13.3.1 Static Dependency

Table 3-149 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-149. CD\_DSS Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_DSS_STATICDEP[2] IVAHD_STATDEP	Read/Write

**Table 3-149. CD\_DSS Static Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always enabled	CM_DSS_STATICDEP[5] L3_1_STATDEP	Read only
CD_L3_2	Disabled	CM_DSS_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_EMIF	Disabled	CM_DSS_STATICDEP[4] MEMIF_STATDEP	Read/Write

**3.6.13.3.2 Dynamic Dependency**

Table 3-150 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-150. CD\_DSS Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always disabled	CM_DSS_DYNAMICDEP[5] L3_1_DYNDEP	Read only

**3.6.13.3.3 Wake-Up Dependency**

Table 3-151 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-151. CD\_DSS Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-DSI1	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[7] WKUPDEP_DSI1_S DMA	Read/Write
DSS-DSI1	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[6] WKUPDEP_DSI1_D SP	Read/Write
DSS-DSI1	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[5] WKUPDEP_DSI1_ MPU_M3	Read/Write
DSS-DSI1	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[4] WKUPDEP_DSI1_ MPU	Read/Write
DSS-DSI2	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[9] WKUPDEP_DSI2_ MPU_M3	Read/Write
DSS-DSI2	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[8] WKUPDEP_DSI2_ MPU	Read/Write
DSS-DSI2	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[11] WKUPDEP_DSI2_S DMA	Read/Write
DSS-DSI2	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[10] WKUPDEP_DSI2_D SP	Read/Write

**Table 3-151. CD\_DSS Wake-Up Dependency Association Parameters (continued)**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-HDMI	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Enabled	PM_DSS_DSS_WK DEP[19] WKUPDEP_HDMID MA_SDMA	Read/Write
DSS-HDMI	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[14] WKUPDEP_HDMII RQ_DSP	Read/Write
DSS-HDMI	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[13] WKUPDEP_HDMII RQ_MPU_M3	Read/Write
DSS-HDMI	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[12] WKUPDEP_HDMII RQ_MPU	Read/Write
DSS-DISPC	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[1] WKUPDEP_DISPC _MPU_M3	Read/Write
DSS-DISPC	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[0] WKUPDEP_DISPC _MPU	Read/Write
DSS-DISPC	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[2] WKUPDEP_DISPC _DSP	Read/Write
DSS-DISPC	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[3] WKUPDEP_DISPC _SDMA	Read/Write

**3.6.13.4 Clock Domain Module Attributes**

Table 3-152 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-152. CD\_DSS Modules Clocks Association**

Module	Clock	Clock Type
DSS	DSS_ALWON_SYS_CLK	Functional
	DSS_FCLK	Functional
	DSS_TV_FCLK	Functional
	HDMI_PHY_48M_FCLK	Functional
	DSS_L3_ICLK	Interface
	DSS_L4_ICLK	Interface

**NOTE:** DSS\_TV\_FCLK is sourced from `fref_slicer_in` input pin. To enable DSS\_TV\_FCLK it must be ungated in `ALTCLKSRC[3] ENABLE_EXT` and must be enabled in `CM_DSS_DSS_CLKCTRL[11] OPTFCLKEN_TV_FCLK`.

Table 3-153 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-153. CD\_DSS Modules Wake-Up Request**

Module	Wake-Up Feature
DSS	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)

Table 3-154 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-154. CD\_DSS Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
DSS	Master/Slave	CM_DSS_DSS_CLKCTRL[18] STBYST	Standby status
		CM_DSS_DSS_CLKCTRL[17:16] IDLEST	Idle status

Table 3-155 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-155. CD\_DSS Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSS	Available	N/A	Available	CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE	Read/Write

### 3.6.14 CD\_L4\_CFG Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.14.1 Overview

Figure 3-58 shows the overview of the clock domain.

**Figure 3-58. CD\_L4\_CFG Overview**

#### 3.6.14.2 Clock Domain Modes

Table 3-156 lists the clock domain modes supported by the clock domain.

**Table 3-156. CD\_L4\_CFG Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-157 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-157. CD\_L4\_CFG Control and Status Parameters**

Parameter Name	Control/Status Bit Field
CFG_L4_ICLK clock status	CM_L4CFG_CLKSTCTRL[8] CLKACTIVITY_CFG_L4_ICLK
Clock Domain State Transition Control	CM_L4CFG_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.14.3 Clock Domain Dependency

CD\_L4\_CFG has no static or module wake-up dependency with any other clock domain of the device.

#### 3.6.14.3.1 Dynamic Dependency

Table 3-158 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-158. CD\_L4\_CFG Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_C2C	Always enabled	CM_L4CFG_DYNAMICDEP[18] C2C_DYNDEP	Read only
CD_DSS	Always enabled	CM_L4CFG_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_CAM	Always disabled	CM_L4CFG_DYNAMICDEP[9] ISS_DYNDEP	Read only
CD_L3_1	Always enabled	CM_L4CFG_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_L3_2	Always enabled	CM_L4CFG_DYNAMICDEP[6] L3_2_DYNDEP	Read only
CD_L3_INIT	Always enabled	CM_L4CFG_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_EMIF	Always enabled	CM_L4CFG_DYNAMICDEP[4] MEMIF_DYNDEP	Read only
CD_DMA	Always enabled	CM_L4CFG_DYNAMICDEP[11] SDMA_DYNDEP	Read only
CD_DSP	Always enabled	CM_L4CFG_DYNAMICDEP[1] DSP_DYNDEP	Read only

### 3.6.14.4 Clock Domain Module Attributes

Table 3-159 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-159. CD\_L4\_CFG Modules Clocks Association**

Module	Clock	Clock Type
SYSCTRL_PADCONF_CORE	CFG_L4_ICLK	Functional
SYSCTRL_GENERAL_CORE	CFG_L4_ICLK	Functional
SPINLOCK	CFG_L4_ICLK	Interface
L4_CFG interconnect	CFG_L4_ICLK	Interface
MAILBOX	CFG_L4_ICLK	Interface
SAR_ROM	CFG_L4_ICLK	Interface

Table 3-160 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-160. CD\_L4\_CFG Modules Wake-Up Request**

Module	Wake-Up Feature
SYSCTRL_PADCONF_CORE	None
SYSCTRL_GENERAL_CORE	None
SPINLOCK	None
L4_CFG interconnect	None
MAILBOX	None
SAR_ROM	None

Table 3-161 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-161. CD\_L4\_CFG Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
SPINLOCK	Slave	CM_L4CFG_SPINLOCK_CLKCTRL[17:16] IDLEST	Idle status
L4_CFG interconnect	Slave	CM_L4CFG_L4_CFG_CLKCTRL[17:16] IDLEST	Idle status
MAILBOX	Slave	CM_L4CFG_MAILBOX_CLKCTRL[17:16] IDLEST	Idle status
SAR_ROM	Slave	CM_L4CFG_SAR_ROM_CLKCTRL[17:16] IDLEST	Idle status

Table 3-162 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-162. CD\_L4\_CFG Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SPINLOCK	N/A	Available	N/A	CM_L4CFG_SPINLOCK_CLKCTRL[1:0] MODULEMODE	Read only
L4_CFG interconnect	N/A	Available	N/A	CM_L4CFG_L4_CFG_CLKCTRL[1:0] MODULEMODE	Read only
MAILBOX	N/A	Available	N/A	CM_L4CFG_MAILBOX_CLKCTRL[1:0] MODULEMODE	Read only
SAR_ROM	N/A	Available	N/A	CM_L4CFG_SAR_ROM_CLKCTRL[1:0] MODULEMODE	Read only

### 3.6.15 CD\_L3\_INSTR Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.15.1 Overview

Figure 3-59 shows the overview of the clock domain.

Figure 3-59. CD\_L3\_INSTR Overview

### 3.6.15.2 Clock Domain Modes

Table 3-163 lists the clock domain modes supported by the clock domain.

Table 3-163. CD\_L3\_INSTR Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-164 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-164. CD\_L3\_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
INSTR_L3_ICLK clock status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3_INSTR_ICLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.15.3 Clock Domain Dependency

CD\_L3\_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device

### 3.6.15.4 Clock Domain Module Attributes

Table 3-165 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-165. CD\_L3\_INSTR Modules Clocks Association

Module	Clock	Clock Type
L3_3 interconnect	INSTR_L3_ICLK	Interface
	INSTR_L4_ICLK	Interface
L3_INSTR interconnect	INSTR_L3_ICLK	Interface
INTERCONN_WP1	INSTR_L3_ICLK	Interface
	INSTR_L4_ICLK	Interface

Table 3-166 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-166. CD\_L3\_INSTR Modules Wake-Up Request**

Module	Wake-Up Feature
L3_3 interconnect	None
L3_INSTR interconnect	None

Table 3-167 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-167. CD\_L3\_INSTR Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
L3_3 interconnect	Slave	CM_L3INSTR_L3_3_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_3_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
L3_INSTR interconnect	Slave	CM_L3INSTR_L3_INSTR_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[17:16] IDLEST	Idle status

Table 3-168 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-168. CD\_L3\_INSTR Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_3 interconnect	Available	Available	N/A	CM_L3INSTR_L3_3_CLKCTRL[1:0] MODULEMODE	Read/Write
L3_3 interconnect	Available	Available	N/A	CM_L3INSTR_L3_3_CLKCTRL_RESTORE[1:0] MODULEMODE	Read/Write
L3_INSTR interconnect	Available	Available	N/A	CM_L3INSTR_L3_INSTR_CLKCTRL[1:0] MODULEMODE	Read/Write
L3_INSTR interconnect	Available	Available	N/A	CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[1:0] MODULEMODE	Read/Write

### 3.6.16 CD\_L3\_2 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.16.1 Overview

Figure 3-60 shows the overview of the clock domain.

Figure 3-60. CD\_L3\_2 Overview

### 3.6.16.2 Clock Domain Modes

Table 3-169 lists the clock domain modes supported by the clock domain.

Table 3-169. CD\_L3\_2 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-170 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-170. CD\_L3\_2 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3_ICLK2 clock status	CM_L3_2_CLKSTCTRL[8] CLKACTIVITY_L3_2_ICLK
Clock Domain State Transition Control	CM_L3_2_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.16.3 Clock Domain Dependency

CD\_L3\_2 has no static or module wake-up dependency with any other clock domain of the device.

#### 3.6.16.3.1 Dynamic Dependency

Table 3-171 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-171. CD\_L3\_2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_C2C	Always enabled	CM_L3_2_DYNAMICDEP[18] C2C_DYNDEP	Read only
CD_DSS	Always enabled	CM_L3_2_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_CORTEXM3	Always enabled	CM_L3_2_DYNAMICDEP[0] MPU_M3_DYNDEP	Read only
CD_SGX	Always enabled	CM_L3_2_DYNAMICDEP[10] SGX_DYNDEP	Read only
CD_CAM	Always disabled	CM_L3_2_DYNAMICDEP[9] ISS_DYNDEP	Read only
CD_IVAHD	Always enabled	CM_L3_2_DYNAMICDEP[2] IVAHD_DYNDEP	Read only

**Table 3-171. CD\_L3\_2 Dynamic Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always enabled	<a href="#">CM_L3_2_DYNAMICDEP</a> [5] L3_1_DYNDEP	Read only
CD_L3_INIT	Always enabled	<a href="#">CM_L3_2_DYNAMICDEP</a> [7] L3INIT_DYNDEP	Read only
CD_L4_PER	Always enabled	<a href="#">CM_L3_2_DYNAMICDEP</a> [13] L4PER_DYNDEP	Read only

### 3.6.16.4 Clock Domain Module Attributes

[Table 3-172](#) lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-172. CD\_L3\_2 Modules Clocks Association**

Module	Clock	Clock Type
GPMC	L3_ICLK2	Interface
L3_2 interconnect	L3_ICLK2	Interface
	L4_ICLK2	Interface
OCMC_RAM	L3_ICLK2	Interface

[Table 3-173](#) lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-173. CD\_L3\_2 Modules Wake-Up Request**

Module	Wake-Up Feature
GPMC	None
L3_2 interconnect	None
OCMC_RAM	None

[Table 3-174](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-174. CD\_L3\_2 Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
GPMC	Slave	<a href="#">CM_L3_2_GPMC_CLKCTRL</a> [17:16] IDLEST	Idle status
L3_2 interconnect	Slave	<a href="#">CM_L3_2_L3_2_CLKCTRL</a> [17:16] IDLEST	Idle status
OCMC_RAM	Slave	<a href="#">CM_L3_2_OCMC_RAM_CLKCTRL</a> [17:16] IDLEST	Idle status

[Table 3-175](#) lists the supported clock management modes and associated software control bit fields for each module of the power domain.

**Table 3-175. CD\_L3\_2 Modules Slave Clock Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPMC	Available	Available	N/A	<a href="#">CM_L3_2_GPMC_CLKCTRL</a> [1:0] MODULEMODE	Read/Write
L3_2 interconnect	N/A	Available	N/A	<a href="#">CM_L3_2_L3_2_CLKCTRL</a> [1:0] MODULEMODE	Read only
OCMC_RAM	N/A	Available	N/A	<a href="#">CM_L3_2_OCMC_RAM_CLKCTRL</a> [1:0] MODULEMODE	Read only

### 3.6.17 CD\_L3\_1 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.17.1 Overview

Figure 3-61 shows the overview of the clock domain.

Figure 3-61. CD\_L3\_1 Overview

#### 3.6.17.2 Clock Domain Modes

Table 3-176 lists the clock domain modes supported by the clock domain.

Table 3-176. CD\_L3\_1 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-177 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-177. CD\_L3\_1 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3_ICLK1 clock status	CM_L3_1_CLKSTCTRL[8] CLKACTIVITY_L3_1_ICLK
Clock Domain State Transition Control	CM_L3_1_CLKSTCTRL[1:0] CLKTRCTRL

#### 3.6.17.3 Clock Domain Dependency

CD\_L3\_1 has no static or module wake-up dependency with any other clock domain of the device.

##### 3.6.17.3.1 Dynamic Dependency

Table 3-178 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-178. CD\_L3\_1 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_L3_1_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_L3_2	Always enabled	CM_L3_1_DYNAMICDEP[6] L3_2_DYNDEP	Read only
CD_L4_CFG	Always enabled	CM_L3_1_DYNAMICDEP[12] L4CFG_DYNDEP	Read only

**Table 3-178. CD\_L3\_1 Dynamic Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_EMIF	Always enabled	CM_L3_1_DYNAMICDEP[4] MEMIF_DYNDEP	Read only

### 3.6.17.4 Clock Domain Module Attributes

Table 3-179 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-179. CD\_L3\_1 Modules Clocks Association**

Module	Clock	Clock Type
L3_1 interconnect	L3_ICLK1	Interface
	L4_ICLK1	Interface

Table 3-180 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-180. CD\_L3\_1 Modules Wake-Up Request**

Module	Wake-Up Feature
L3_1 interconnect	None

Table 3-181 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

**Table 3-181. CD\_L3\_1 Modules Clock Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
L3_1 interconnect	Slave	CM_L3_1_L3_1_CLKCTRL[17: 16] IDLEST	Idle status

Table 3-182 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

**Table 3-182. CD\_L3\_1 Modules Slave Clock Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_1 interconnect	N/A	Available	N/A	CM_L3_1_L3_1_CLKCTRL[1:0] MODULEMODE	Read only

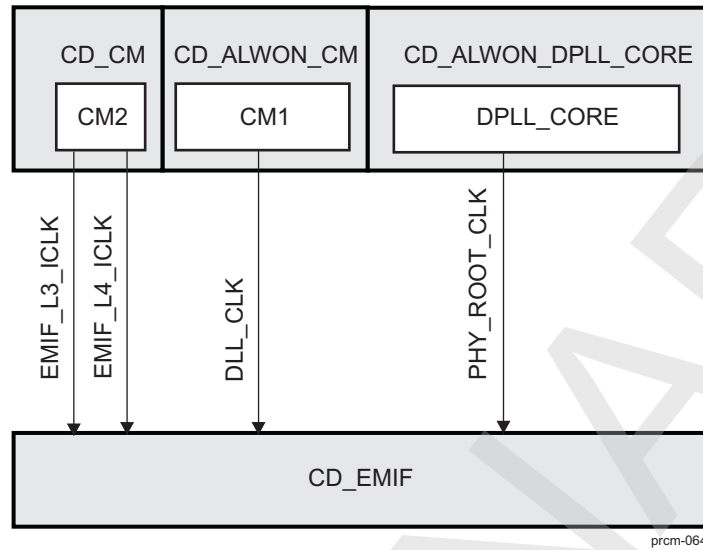

## 3.6.18 CD\_EMIF Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

### 3.6.18.1 Overview

Figure 3-62 shows the overview of the clock domain.

Figure 3-62. CD\_EMIF Overview

3.6.18.2 Clock Domain Modes

Table 3-183 lists the clock domain modes supported by the clock domain.

Table 3-183. CD\_EMIF Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-184 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-184. CD\_EMIF Control and Status Parameters

Parameter Name	Control/Status Bit Field
DLL_CLK clock status	CM_MEMIF_CLKSTCTRL[9] CLKACTIVITY_DLL_CLK
EMIF_L3_ICLK clock status	CM_MEMIF_CLKSTCTRL[8] CLKACTIVITY_L3_EMIF_ICLK
PHY_ROOT_CLK clock status	CM_MEMIF_CLKSTCTRL[10] CLKACTIVITY_PHY_ROOT_CLK
Clock Domain State Transition Control	CM_MEMIF_CLKSTCTRL[1:0] CLKTRCTRL

3.6.18.3 Clock Domain Dependency

CD\_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.18.4 Clock Domain Module Attributes

Table 3-185 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-185. CD\_EMIF Modules Clocks Association

Module	Clock	Clock Type
DLL	DLL_CLK	Functional
DMM	EMIF_L3_ICLK	Interface
EMIF1	DLL_CLK	Interface
	EMIF_L3_ICLK	Interface

**Table 3-185. CD\_EMIF Modules Clocks Association (continued)**

Module	Clock	Clock Type
EMIF2	PHY_ROOT_CLK <sup>(1)</sup>	Interface
	PHY_ROOT_CLK <sup>(1)</sup>	Interface
	DLL_CLK	Interface
	EMIF_L3_ICLK	Interface
EMIF_FW	PHY_ROOT_CLK <sup>(1)</sup>	Interface
	PHY_ROOT_CLK <sup>(1)</sup>	Interface
	EMIF_L3_ICLK	Interface
	EMIF_L4_ICLK	Interface

<sup>(1)</sup> One PHY\_ROOT\_CLK goes directly into the module. The second PHY\_ROOT\_CLK passes through DDRPHY before going into the module.

Table 3-186 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-186. CD\_EMIF Modules Wake-Up Request**

Module	Wake-Up Feature
DDRPHY	None
DLL	None
DMM	None
EMIF1	None
EMIF2	None
EMIF_FW	None

Table 3-187 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-187. CD\_EMIF Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
DMM	Slave	CM_MEMIF_DMM_CLKCTRL[17:16] IDLEST	Idle status
EMIF1	Slave	CM_MEMIF_EMIF_1_CLKCTRL[17:16] IDLEST	Idle status
EMIF2	Slave	CM_MEMIF_EMIF_2_CLKCTRL[17:16] IDLEST	Idle status
EMIF_FW	Slave	CM_MEMIF_EMIF_FW_CLKCTRL[17:16] IDLEST	Idle status

Table 3-188 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-188. CD\_EMIF Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DMM	N/A	Available	N/A	CM_MEMIF_DMM_CLKCTRL[1:0] MODULEMODE	Read only
EMIF1	Available	Available	N/A	CM_MEMIF_EMIF_1_CLKCTRL[1:0] MODULEMODE	Read/Write
EMIF2	Available	Available	N/A	CM_MEMIF_EMIF_2_CLKCTRL[1:0] MODULEMODE	Read/Write
EMIF_FW	N/A	Available	N/A	CM_MEMIF_EMIF_FW_CLKCTRL[1:0] MODULEMODE	Read only

### 3.6.19 CD\_CORTEXM3 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.19.1 Overview

Figure 3-63 shows the overview of the clock domain.

Figure 3-63. CD\_CORTEXM3 Overview

#### 3.6.19.2 Clock Domain Modes

Table 3-189 lists the clock domain modes supported by the clock domain.

Table 3-189. CD\_CORTEXM3 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-190 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-190. CD\_CORTEXM3 Control and Status Parameters

Parameter Name	Control/Status Bit Field
MPU_M3_CLK clock status	CM_MPU_M3_CLKSTCTRL[8] CLKACTIVITY_MPU_M3_CLK
Clock Domain State Transition Control	CM_MPU_M3_CLKSTCTRL[1:0] CLKTRCTRL

#### 3.6.19.3 Clock Domain Dependency

CD\_CORTEXM3 has no module wake-up dependency with any other clock domain of the device.

##### 3.6.19.3.1 Static Dependency

Table 3-191 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-191. CD\_CORTEXM3 Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_MPU_M3_STATICDEP[3] ABE_STATDEP	Read/Write
CD_DSS	Disabled	CM_MPU_M3_STATICDEP[8] DSS_STATDEP	Read/Write

**Table 3-191. CD\_CORTEXM3 Static Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_SGX	Disabled	CM_MPU_M3_STATICDEP[10] ] SGX_STATDEP	Read/Write
CD_CAM	Always disabled	CM_MPU_M3_STATICDEP[9] ISS_STATDEP	Read only
CD_IVAHD	Disabled	CM_MPU_M3_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Enabled	CM_MPU_M3_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Enabled	CM_MPU_M3_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_L3_INIT	Disabled	CM_MPU_M3_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Enabled	CM_MPU_M3_STATICDEP[12] ] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_MPU_M3_STATICDEP[13] ] L4PER_STATDEP	Read/Write
CD_EMIF	Enabled	CM_MPU_M3_STATICDEP[4] MEMIF_STATDEP	Read/Write
CD_DMA	Always disabled	CM_MPU_M3_STATICDEP[11] ] SDMA_STATDEP	Read only
CD_DSP	Disabled	CM_MPU_M3_STATICDEP[1] DSP_STATDEP	Read/Write

### 3.6.19.3.2 Dynamic Dependency

Table 3-192 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-192. CD\_CORTEXM3 Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_CAM	Always disabled	CM_MPU_M3_DYNAMICDEP[9] ISS_DYNDEP	Read only
CD_L3_2	Always enabled	CM_MPU_M3_DYNAMICDEP[6] L3_2_DYNDEP	Read only

### 3.6.19.4 Clock Domain Module Attributes

Table 3-193 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-193. CD\_CORTEXM3 Modules Clocks Association**

Module	Clock	Clock Type
CORTEXM3	MPU_M3_CLK	Interface and functional

Table 3-194 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-194. CD\_CORTEXM3 Modules Wake-Up Request**

Module	Wake-Up Feature
CORTEXM3	Master wake-up request

Table 3-195 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-195. CD\_CORTEXM3 Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
CORTEXM3	Master/Slave	CM_MPU_M3_MPU_M3_CLK_CTRL[18] STBYST	Standby status
		CM_MPU_M3_MPU_M3_CLK_CTRL[17:16] IDLEST	Idle status

Table 3-196 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-196. CD\_CORTEXM3 Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
CORTEXM3	Available	Available	N/A	CM_MPU_M3_MPU_M3_CLKCTRL[1:0] MODULEMODE	Read/Write

### 3.6.20 CD\_DMA Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.20.1 Overview

Figure 3-64 shows the overview of the clock domain.

**Figure 3-64. CD\_DMA Overview**

#### 3.6.20.2 Clock Domain Modes

Table 3-197 lists the clock domain modes supported by the clock domain.

**Table 3-197. CD\_DMA Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-198 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-198. CD\_DMA Control and Status Parameters**

Parameter Name	Control/Status Bit Field
DMA_L3_ICLK clock status	CM_SDMA_CLKSTCTRL[8] CLKACTIVITY_DMA_L3_ICLK
Clock Domain State Transition Control	CM_SDMA_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.20.3 Clock Domain Dependency

CD\_DMA has a permanently enabled static dependency to the CD\_L3\_2 clock domain. It has no dynamic or module wake-up dependency with any other clock domain of the device.

### 3.6.20.4 Clock Domain Module Attributes

Table 3-199 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-199. CD\_DMA Modules Clocks Association**

Module	Clock	Clock Type
sDMA	DMA_L3_ICLK	Interface and Functional
	DMA_L4_ICLK	Interface

Table 3-200 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-200. CD\_DMA Modules Wake-Up Request**

Module	Wake-Up Feature
sDMA	Master wake-up request

Table 3-201 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-201. CD\_DMA Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
sDMA	Master/Slave	CM_SDMA_SDMA_CLKCTRL[18] STBYST	Standby status
		CM_SDMA_SDMA_CLKCTRL[17:16] IDLEST	Idle status

Table 3-202 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

**Table 3-202. CD\_DMA Modules Slave Clock Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
sDMA	N/A	Available	N/A	CM_SDMA_SDMA_CLKCTRL[1:0] MODULEMODE	Read only

## 3.6.21 CD\_C2C Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

### 3.6.21.1 Overview

Figure 3-65 shows the overview of the clock domain.

Figure 3-65. CD\_C2C Overview

### 3.6.21.2 Clock Domain Modes

Table 3-203 lists the clock domain modes supported by the clock domain.

Table 3-203. CD\_C2C Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-204 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-204. CD\_C2C Control and Status Parameters

Parameter Name	Control/Status Bit Field
C2C_L3_ICLK clock status	CM_C2C_CLKSTCTRL[8] CLKACTIVITY_L3_C2C_ICLK
C2C_L3X2_ICLK clock status	CM_C2C_CLKSTCTRL[10] CLKACTIVITY_L3X2_C2C_ICLK
C2C_L4_ICLK clock status	CM_C2C_CLKSTCTRL[9] CLKACTIVITY_L4_C2C_ICLK
Clock Domain State Transition Control	CM_C2C_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.21.3 Clock Domain Dependency

CD\_C2C has no module wake-up dependency with any other clock domain of the device.

#### 3.6.21.3.1 Static Dependency

Table 3-205 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-205. CD\_C2C Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_C2C_STATICDEP[3] ABE_STATDEP	Read/Write
CD_IVAHD	Disabled	CM_C2C_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_C2C_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Disabled	CM_C2C_STATICDEP[6] L3_2_STATDEP	Read/Write

**Table 3-205. CD\_C2C Static Dependency Association Parameters (continued)**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_INIT	Disabled	CM_C2C_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Disabled	CM_C2C_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_C2C_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_EMIF	Enabled	CM_C2C_STATICDEP[4] MEMIF_STATDEP	Read/Write

### 3.6.21.3.2 Dynamic Dependency

Table 3-206 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-206. CD\_C2C Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always enabled	CM_C2C_DYNAMICDEP[6] L3_2_DYNDEP	Read only
CD_EMIF	Always enabled	CM_C2C_DYNAMICDEP[4] MEMIF_DYNDEP	Read only

### 3.6.21.4 Clock Domain Module Attributes

Table 3-207 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-207. CD\_C2C Modules Clocks Association**

Module	Clock	Clock Type
C2C	C2C_L3X2_ICLK	Interface
	C2C_L3_ICLK	Interface
C2C_FW	C2C_L3_ICLK	Interface
	C2C_L4_ICLK	Interface

Table 3-208 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-208. CD\_C2C Modules Wake-Up Request**

Module	Wake-Up Feature
C2C	Master wake-up request
C2C_FW	None

Table 3-209 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-209. CD\_C2C Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
C2C	Master/Slave	CM_C2C_C2C_CLKCTRL[18] STBYST	Standby status
		CM_C2C_C2C_CLKCTRL[17:16] IDLEST	Idle status
C2C_FW	Slave	CM_C2C_C2C_FW_CLKCTRL [17:16] IDLEST	Idle status

Table 3-210 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-210. CD\_C2C Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
C2C	N/A	Available	N/A	CM_C2C_C2C_CLKCTRL[1:0]MODULEMODE	Read only
C2C_FW	N/A	Available	N/A	CM_C2C_C2C_FW_CLKCTRL[1:0]MODULEMODE	Read only

### 3.6.22 CD\_CAM Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.22.1 Overview

Figure 3-66 shows the overview of the clock domain.

**Figure 3-66. CD\_CAM Overview**

#### 3.6.22.2 Clock Domain Modes

Table 3-211 lists the clock domain modes supported by the clock domain.

**Table 3-211. CD\_CAM Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-212 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-212. CD\_CAM Control and Status Parameters**

Parameter Name	Control/Status Bit Field
CAM_PHY_CTRL_CLK clock status	CM_CAM_CLKSTCTRL[9] CLKACTIVITY_CAM_PHY_CTRL_CLK
FDIF_FCLK clock status	CM_CAM_CLKSTCTRL[10] CLKACTIVITY_FDIF_FCLK
ISS_CLK clock status	CM_CAM_CLKSTCTRL[8] CLKACTIVITY_ISS_CLK

**Table 3-212. CD\_CAM Control and Status Parameters (continued)**

Parameter Name	Control/Status Bit Field
Clock Domain State Transition Control	CM_CAM_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.22.3 Clock Domain Dependency

CD\_CAM has no module wake-up dependency with any other clock domain of the device.

#### 3.6.22.3.1 Static Dependency

Table 3-213 lists the static dependency of the clock domain with respect to other clock domains of the device.

**Table 3-213. CD\_CAM Static Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_CAM_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_CAM_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_CAM_STATICDEP[6] L3_2_STATDEP	Read only
CD_EMIF	Disabled	CM_CAM_STATICDEP[4] MEMIF_STATDEP	Read/Write

#### 3.6.22.3.2 Dynamic Dependency

Table 3-214 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

**Table 3-214. CD\_CAM Dynamic Dependency Association Parameters**

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_CAM_DYNAMICDEP[6] L3_2_DYNDEP	Read only

### 3.6.22.4 Clock Domain Module Attributes

Table 3-215 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-215. CD\_CAM Modules Clocks Association**

Module	Clock	Clock Type
FACE DETECT	FDIF_FCLK	Interface and Functional
ISS	CAM_PHY_CTRL_CLK	Functional
	ISS_CLK	Interface and Functional

Table 3-216 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-216. CD\_CAM Modules Wake-Up Request**

Module	Wake-Up Feature
FACE DETECT	None
ISS	None

Table 3-217 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-217. CD\_CAM Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
FACE DETECT	Master/Slave	CM_CAM_FDIF_CLKCTRL[18] STBYST	Standby status
		CM_CAM_FDIF_CLKCTRL[17:16] IDLEST	Idle status
ISS	Master/Slave	CM_CAM_ISS_CLKCTRL[18] STBYST	Standby status
		CM_CAM_ISS_CLKCTRL[17:16] IDLEST	Idle status

Table 3-218 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-218. CD\_CAM Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
FACE DETECT	Available	N/A	Available	CM_CAM_FDIF_CLKCTRL[1:0] MODULEMODE	Read/Write
ISS	Available	N/A	Available	CM_CAM_ISS_CLKCTRL[1:0] MODULEMODE	Read/Write

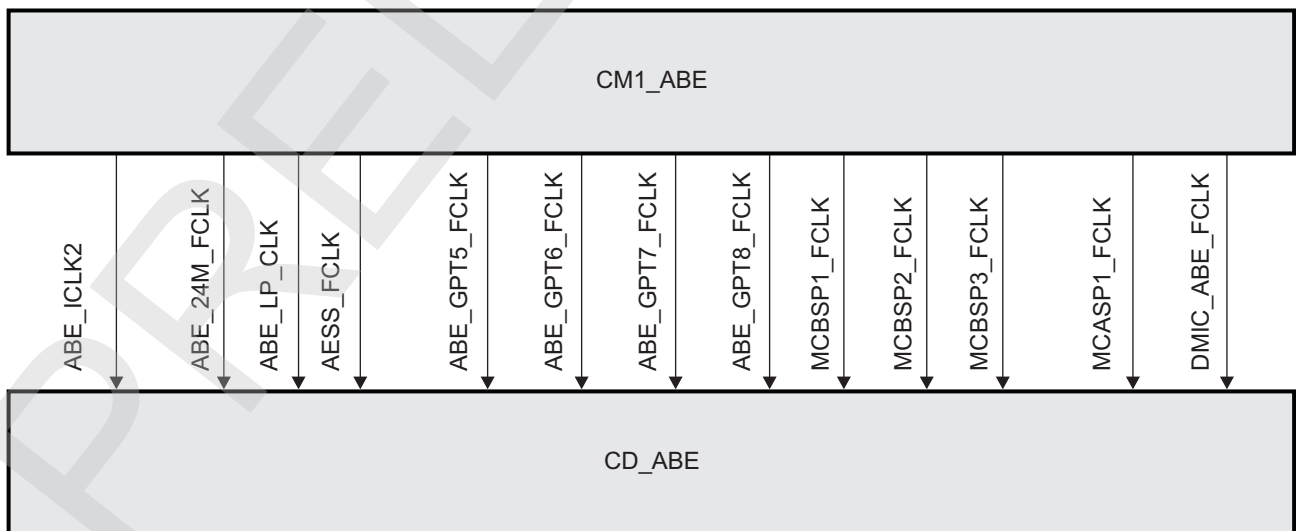

### 3.6.23 CD\_ABE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.23.1 Overview

Figure 3-67 shows the overview of the clock domain.

**Figure 3-67. CD\_ABE Overview**

prcm-069

#### 3.6.23.2 Clock Domain Modes

Table 3-219 lists the clock domain modes supported by the clock domain.

**Table 3-219. CD\_ABE Clock Domain Modes**

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-220 lists the clock domain state transition control and status bits for the clock in this clock domain.

**Table 3-220. CD\_ABE Control and Status Parameters**

Parameter Name	Control/Status Bit Field
ABE_24M_FCLK clock status	CM1_ABE_CLKSTCTRL[13] CLKACTIVITY_ABE_24M_FCLK
ABE_ALWON_32K_CLK clock status	CM1_ABE_CLKSTCTRL[12] CLKACTIVITY_ABE_ALWON_32K_CLK
ABE_SYSCCLK clock status	CM1_ABE_CLKSTCTRL[11] CLKACTIVITY_ABE_SYSCCLK
ABE_X2_CLK clock status	CM1_ABE_CLKSTCTRL[8] CLKACTIVITY_ABE_X2_CLK
24M_FCLK clock status	CM1_ABE_CLKSTCTRL[10] CLKACTIVITY_24M_FCLK
ABE_ICLK2 clock status	CM1_ABE_CLKSTCTRL[9] CLKACTIVITY_ABE_ICLK2
Clock Domain State Transition Control	CM1_ABE_CLKSTCTRL[1:0] CLKTRCTRL

### 3.6.23.3 Clock Domain Dependency

CD\_ABE has no static or dynamic dependency with any other clock domain of the device.

#### 3.6.23.3.1 Wake-Up Dependency

Table 3-221 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-221. CD\_ABE Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DMIC	CD_ABE	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_ABE_DMIC_WKDEP[7] WKUPDEP_DMIC_DMA_SDMA	Read/Write
DMIC	CD_ABE	CD_DSP	Disabled	PM_ABE_DMIC_WKDEP[6] WKUPDEP_DMIC_DMA_DSP	Read/Write
DMIC	CD_ABE	CD_DSP	Disabled	PM_ABE_DMIC_WKDEP[2] WKUPDEP_DMIC_IRQ_DSP	Read/Write
DMIC	CD_ABE	CD_CORTEXA9	Disabled	PM_ABE_DMIC_WKDEP[0] WKUPDEP_DMIC_IRQ_MPU	Read/Write
MCASP1	CD_ABE	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_ABE_MCASP_WKDEP[7] WKUPDEP_MCASP1_DMA_SDMA	Read/Write
MCASP1	CD_ABE	CD_DSP	Disabled	PM_ABE_MCASP_WKDEP[6] WKUPDEP_MCASP1_DMA_DSP	Read/Write
MCASP1	CD_ABE	CD_DSP	Disabled	PM_ABE_MCASP_WKDEP[2] WKUPDEP_MCASP1_IRQ_DSP	Read/Write
MCASP1	CD_ABE	CD_CORTEXA9	Disabled	PM_ABE_MCASP_WKDEP[0] WKUPDEP_MCASP1_IRQ_MPU	Read/Write

**Table 3-221. CD\_ABE Wake-Up Dependency Association Parameters (continued)**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
MCBSP1	CD_ABE	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_ABE_MCBSP1_WKDEP[3] WKUPDEP_MCBS P1_SDMA	Read/Write

WDTIMER3	CD_ABE	CD_CORTEXA9	Always enabled	PM_ABE_WDTIME_R3_WKDEP[0] WKUPDEP_WDT3_MPU	Read only

### 3.6.23.4 Clock Domain Module Attributes

Table 3-222 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-222. CD\_ABE Modules Clocks Association**

Module	Clock	Clock Type
AUDIO ENGINE	AESS_FCLK	Functional
	ABE_ICLK2	Interface
DMIC	DMIC_ABE_FCLK	Functional
	ABE_ICLK2	Interface
L4_ABE interconnect	ABE_ICLK2	Interface
MCASP1	MCASP1_FCLK	Functional

**Table 3-222. CD\_ABE Modules Clocks Association (continued)**

Module	Clock	Clock Type
	ABE_ICLK2	Interface and functional
MCBSP1	MCBSP1_FCLK	Functional
	ABE_ICLK2	Interface
MCBSP2	MCBSP2_FCLK	Functional
	ABE_ICLK2	Interface
MCBSP3	MCBSP3_FCLK	Functional
	ABE_ICLK2	Interface
MCPDM	ABE_ICLK2	Interface
	PAD_CLKS	Functional
SLIMBUS1	ABE_24M_FCLK	Functional
	24M_FCLK	Functional
	ABE_ICLK2	Interface
	PAD_CLKS	Functional
	SLIMBUS_UCLKS	Functional
GPTIMER5	ABE_GPT5_FCLK	Functional
	ABE_ICLK2	Interface
GPTIMER6	ABE_GPT6_FCLK	Functional
	ABE_ICLK2	Interface
GPTIMER7	ABE_GPT7_FCLK	Functional
	ABE_ICLK2	Interface
GPTIMER8	ABE_GPT8_FCLK	Functional
	ABE_ICLK2	Interface
WDTIMER3	ABE_ALWON_32K_CLK	Functional
	ABE_ICLK2	Interface

Table 3-223 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-223. CD\_ABE Modules Wake-Up Request**

Module	Wake-Up Feature
AUDIO ENGINE	None
DMIC	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
L4_ABE interconnect	None
MCASP1	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
MCBSP1	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
MCBSP2	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
MCBSP3	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
MCPDM	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
SLIMBUS1	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
GPTIMER5	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPTIMER6	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPTIMER7	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPTIMER8	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)

**Table 3-223. CD\_ABE Modules Wake-Up Request (continued)**

Module	Wake-Up Feature
WDTIMER3	Slave wake-up request (MPU_A9 -IRQ)

Table 3-224 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-224. CD\_ABE Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
AUDIO ENGINE	Slave/Master	CM1_ABE_AESS_CLKCTRL[18] STBYST	Standby status
		CM1_ABE_AESS_CLKCTRL[17:16] IDLEST	Idle status
DMIC	Slave	CM1_ABE_DMIC_CLKCTRL[17:16] IDLEST	Idle status
L4_ABE interconnect	Slave	CM1_ABE_L4ABE_CLKCTRL[17:16] IDLEST	Idle status
MCASP1	Slave	CM1_ABE_MCASP_CLKCTRL[17:16] IDLEST	Idle status
MCBSP1	Slave	CM1_ABE_MCBSP1_CLKCTRL[17:16] IDLEST	Idle status
MCBSP2	Slave	CM1_ABE_MCBSP2_CLKCTRL[17:16] IDLEST	Idle status
MCBSP3	Slave	CM1_ABE_MCBSP3_CLKCTRL[17:16] IDLEST	Idle status
MCPDM	Slave	CM1_ABE_PDM_CLKCTRL[17:16] IDLEST	Idle status
SLIMBUS1	Slave	CM1_ABE_SLIMBUS_CLKCTRL[17:16] IDLEST	Idle status
GPTIMER5	Slave	CM1_ABE_GPTIMER5_CLKCTRL[17:16] IDLEST	Idle status
GPTIMER6	Slave	CM1_ABE_GPTIMER6_CLKCTRL[17:16] IDLEST	Idle status
GPTIMER7	Slave	CM1_ABE_GPTIMER7_CLKCTRL[17:16] IDLEST	Idle status
GPTIMER8	Slave	CM1_ABE_GPTIMER8_CLKCTRL[17:16] IDLEST	Idle status
WDTIMER3	Slave	CM1_ABE_WDTIMER3_CLKCTRL[17:16] IDLEST	Idle status

Table 3-225 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-225. CD\_ABE Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
AUDIO ENGINE	Available	N/A	Available	CM1_ABE_AESS_CLKCTRL[1:0] MODULEMODE	Read/Write
DMIC	Available	N/A	Available	CM1_ABE_DMIC_CLKCTRL[1:0] MODULEMODE	Read/Write
L4_ABE interconnect	N/A	Available	N/A	CM1_ABE_L4ABE_CLKCTRL[1:0] MODULEMODE	Read only
MCASP1	Available	N/A	Available	CM1_ABE_MCASP_CLKCTRL[1:0] MODULEMODE	Read/Write

**Table 3-225. CD\_ABE Modules Slave Clock-Management Modes and Control (continued)**

WDTIMER3	Available	N/A	Available	CM1_ABE_WDTIMER3_CLKCTRL[1:0] MODULEMODE	Read/Write

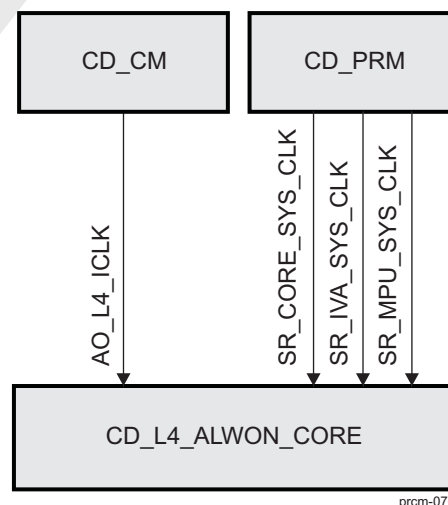

### 3.6.24 CD\_L4\_ALWON\_CORE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.24.1 Overview

Figure 3-68 shows the overview of the clock domain.

**Figure 3-68. CD\_L4\_ALWON\_CORE Overview**

prom-070

### 3.6.24.2 Clock Domain Modes

CD\_L4\_ALWON\_CORE is an always-on clock domain and has no software-controlled clock domain modes management associated.

### 3.6.24.3 Clock Domain Dependency

CD\_L4\_ALWON\_CORE has no static or dynamic dependency with any other clock domain of the device.

#### 3.6.24.3.1 Wake-Up Dependency

Table 3-226 lists the wake-up dependency settings for the modules of this clock domain.

**Table 3-226. CD\_L4\_ALWON\_CORE Wake-Up Dependency Association Parameters**

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
SR_CORE	CD_L4_ALWON_CORE	CD_CORTEXM3	Disabled	PM_ALWON_SR_CORE_WKDEP[1] WKUPDEP_SR_CORE_MPU_M3	Read/Write
	CD_L4_ALWON_CORE	CD_CORTEXA9	Disabled	PM_ALWON_SR_CORE_WKDEP[0] WKUPDEP_SR_CORE_MPU	Read/Write
SR_IVA	CD_L4_ALWON_CORE	CD_CORTEXM3	Disabled	PM_ALWON_SR_IVA_WKDEP[1] WKUPDEP_SR_IVA_MPU_M3	Read/Write
	CD_L4_ALWON_CORE	CD_CORTEXA9	Disabled	PM_ALWON_SR_IVA_WKDEP[0] WKUPDEP_SR_IVA_MPU	Read/Write
SR_MPU	CD_L4_ALWON_CORE	CD_CORTEXA9	Always enabled	PM_ALWON_SR_MPU_WKDEP[0] WKUPDEP_SR_MPU_MPU	Read only

### 3.6.24.4 Clock Domain Module Attributes

Table 3-227 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

**Table 3-227. CD\_L4\_ALWON\_CORE Modules Clocks Association**

Module	Clock	Clock Type
SR_CORE	AO_L4_ICLK	Interface
	SR_CORE_SYS_CLK	Functional
SR_IVA	AO_L4_ICLK	Interface
	SR_IVA_SYS_CLK	Functional
SR_MPU	AO_L4_ICLK	Interface
	SR_MPU_SYS_CLK	Functional

Table 3-228 lists the supported wake-up request generation capability for each module of the clock domain.

**Table 3-228. CD\_L4\_ALWON\_CORE Modules Wake-Up Request**

Module	Wake-Up Feature
SR_CORE	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
SR_IVA	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
SR_MPU	Slave wake-up request (MPU_A9 -IRQ)

Table 3-229 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-229. CD\_L4\_ALWON\_CORE Modules Clock-Management Modes and Control**

Module	Clock-Management Protocol	Status Bit Field	Role
SR_CORE	Slave	CM_ALWON_SR_CORE_CLKCTRL[17:16] IDLEST	Idle status
SR_IVA	Slave	CM_ALWON_SR_IVA_CLKCTRL[17:16] IDLEST	Idle status
SR_MPU	Slave	CM_ALWON_SR_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-230 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

**Table 3-230. CD\_L4\_ALWON\_CORE Modules Slave Clock-Management Modes and Control**

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SR_CORE	Available	N/A	Available	CM_ALWON_SR_CORE_CLKCTRL[1:0] MODULEMODE	Read/Write
SR_IVA	Available	N/A	Available	CM_ALWON_SR_IVA_CLKCTRL[1:0] MODULEMODE	Read/Write
SR_MPU	Available	N/A	Available	CM_ALWON_SR_MPU_CLKCTRL[1:0] MODULEMODE	Read/Write

### 3.7 Power Management Functional Description

This section highlights the functional concepts of power domain level power management in the device.

The following power domains support the DPS with switching times of less than 5  $\mu$ s.

- PD\_CORE
- PD\_DSP
- PD\_MPU

#### 3.7.1 PD\_WKUP Description

PD\_WKUP contains the following reset domains:

- WKUP\_PWRON\_RST
- WKUP\_RST
- WKUP\_SYS\_PWRON\_RST

PD\_WKUP contains CD\_WKUP clock domain.

Table 3-231 lists the logic retention capability for each module of the power domain.

**Table 3-231. PD\_WKUP Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
SYSCTRL_PADCONF_WKUP	No	None	None
BANDGAP	No	None	None
SYSCTRL_GENERAL_WKUP	No	None	None
GPIO1	No	RM_WKUP_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
KEYBOARD	No	RM_WKUP_KEYBOARD_CONTEXT[0] LOSTCONTEXT_DFF	None
PRM	No	None	None

**Table 3-231. PD\_WKUP Modules Power Attributes (continued)**

Module	Logic Retention	DFF Context Status	RFF Context Status
SAR_RAM	No	<a href="#">RM_WKUP_SARRAM_CONTEXT[0]</a> LOSTCONTEXT_DFF	None
SCRM	No	None	None
32KTIMER	No	<a href="#">RM_WKUP_32KTIMER_CONTEXT[0]</a> LOSTCONTEXT_DFF	None
GPTIMER1	No	<a href="#">RM_WKUP_GPTIMER1_CONTEXT[0]</a> LOSTCONTEXT_DFF	None
WDTIMER2	No	<a href="#">RM_WKUP_WDTIMER2_CONTEXT[0]</a> LOSTCONTEXT_DFF	None
L4_WKUP interconnect	No	<a href="#">RM_WKUP_L4WKUP_CONTEXT[0]</a> LOSTCONTEXT_DFF	None

### 3.7.1.1 Power Domain Modes

The PD\_WKUP power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD\_WKUP power domain has no memory banks.

### 3.7.2 PD\_DSP Description

PD\_DSP contains the following reset domains:

- DSP\_RST
- DSP\_PWRON\_RST
- DSP\_RET\_RST
- DSP\_SYS\_RST

PD\_DSP contains the CD\_DSP clock domain.

[Table 3-232](#) lists the logic retention capability for each module of the power domain.

**Table 3-232. PD\_DSP Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP	Partial	<a href="#">RM_DSP_DSP_CONTEXT[0]</a> LOSTCONTEXT_DFF	<a href="#">RM_DSP_DSP_CONTEXT[1]</a> LOSTCONTEXT_RFF

### 3.7.2.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#), for a functional description of the power-management architecture of a generic power domain.

#### 3.7.2.1.1 Logic and Memory Area Power Modes

[Table 3-233](#) lists the power modes supported by the logic area of the power domain.

**Table 3-233. PD\_DSP Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-234](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-234. PD\_DSP Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
DSP_EDMA		ON	RETENTION	OFF	
	DSP - DSP_EDMA	always_on	always_retention		always_enabled
DSP_L1		ON	OFF, RETENTION	OFF	
	DSP - DSP_L1	always_on	software_control		None
DSP_L2		ON	OFF, RETENTION	OFF	
	DSP - DSP_L2	always_on	software_control		always_enabled

### 3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-235 lists the power modes controls for the power domain.

**Table 3-235. PD\_DSP Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	DSP_L2	PM_DSP_PWRSTCTRL[9] DSP_L2_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	DSP_L1	PM_DSP_PWRSTCTRL[8] DSP_L1_RETSTATE	Read/Write
Power Domain - Low Power State Change Control		PM_DSP_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	DSP_EDMA	PM_DSP_PWRSTCTRL[21:20] DSP_EDMA_ONSTATE	Read only
Logic Area - Retention State Control		PM_DSP_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	DSP_L2	PM_DSP_PWRSTCTRL[19:18] DSP_L2_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	DSP_L1	PM_DSP_PWRSTCTRL[17:16] DSP_L1_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	DSP_EDMA	PM_DSP_PWRSTCTRL[10] DSP_EDMA_RETSTATE	Read only
Power Domain - State Transition Control		PM_DSP_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-236 lists the power modes status for the power domain.

**Table 3-236. PD\_DSP Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_DSP_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	DSP_EDMA	PM_DSP_PWRSTST[9:8] DSP_EDMA_STATEST
Memory Area - State Status	DSP_L2	PM_DSP_PWRSTST[7:6] DSP_L2_STATEST
Memory Area - State Status	DSP_L1	PM_DSP_PWRSTST[5:4] DSP_L1_STATEST
Power Domain - State Transition Status		PM_DSP_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_DSP_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_DSP_PWRSTST[1:0] POWERSTATEST

### 3.7.3 PD\_STD\_EFUSE Description

PD\_STD\_EFUSE contains the STD\_EFUSE\_PWRON\_RST reset domain.

PD\_STD\_EFUSE contains the CD\_STD\_EFUSE clock domain.

Table 3-237 lists the logic retention capability for each module of the power domain.

**Table 3-237. PD\_STD\_EFUSE Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
STD_EFUSE	No	None	None

### 3.7.3.1 Power Domain Modes

The PD\_STD\_EFUSE power domain is hardware-controlled by the PRCM module and has no software control associated. It is switched to ON power state when the device is powered on and switched to OFF power state after the power-up sequence of the device.

The PD\_STD\_EFUSE power domain has no memory banks.

### 3.7.4 PD\_MPU Description

PD\_MPU contains the following reset domains:

- CORTEXA9\_PWRON\_RST
- CORTEXA9\_RST

PD\_MPU contains the CD\_CORTEXA9 clock domain.

Table 3-238 lists the logic retention capability for each module of the power domain.

**Table 3-238. PD\_MPU Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
CORTEXA9	No	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	None

### 3.7.4.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

#### 3.7.4.1.1 Logic and Memory Area Power Modes

Table 3-239 lists the power modes supported by the logic area of the power domain.

**Table 3-239. PD\_MPU Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

Table 3-240 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-240. PD\_MPU Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
MPU_L1		ON	OFF, RETENTION	OFF	
	CORTEXA9 - MPU_L1	always_on	software_control		None
MPU_L2		ON	OFF, RETENTION	OFF	
	CORTEXA9 - MPU_L2	always_on	software_control		always_enabled

**Table 3-240. PD\_MPU Memory Area Power Modes (continued)**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
MPU_RAM		ON	RETENTION	OFF	
	CORTEXA9 - MPU_RAM	always_on	always_retention		always_enabled

### 3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-241 lists the power modes controls for the power domain.

**Table 3-241. PD\_MPU Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	MPU_L1	PM_MPU_PWRSTCTRL[8] MPU_L1_RETSTATE	Read/Write
Power Domain - Low Power State Change Control		PM_MPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read only
Memory Area - State Control (Logic in On state)	MPU_RAM	PM_MPU_PWRSTCTRL[21:20] ] MPU_RAM_ONSTATE	Read only
Logic Area - Retention State Control		PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	MPU_L2	PM_MPU_PWRSTCTRL[19:18] ] MPU_L2_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_L1	PM_MPU_PWRSTCTRL[17:16] ] MPU_L1_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	MPU_RAM	PM_MPU_PWRSTCTRL[10] MPU_RAM_RETSTATE	Read only
Power Domain - State Transition Control		PM_MPU_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-242 lists the power modes status for the power domain.

**Table 3-242. PD\_MPU Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Memory Area - State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area - State Status	MPU_L1	PM_MPU_PWRSTST[5:4] MPU_L1_STATEST
Power Domain - State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

### 3.7.5 PD\_L4\_PER Description

PD\_L4\_PER contains the following reset domains:

- L4\_PER\_PWRON\_RET\_RST
- L4\_PER\_RET\_RST
- L4\_PER\_RST

PD\_L4\_PER contains the CD\_L4\_PER clock domain.

Table 3-243 lists the logic retention capability for each module of the power domain.

**Table 3-243. PD\_L4\_PER Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
GPTIMER10	No	RM_L4PER_GPTIMER10_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER11	No	RM_L4PER_GPTIMER11_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER2	No	RM_L4PER_GPTIMER2_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER3	No	RM_L4PER_GPTIMER3_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER4	No	RM_L4PER_GPTIMER4_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER9	No	RM_L4PER_GPTIMER9_CONTEXT[0] LOSTCONTEXT_DFF	None
ELM	No	RM_L4PER_ELM_CONTEXT[0] LOSTCONTEXT_DFF	None
GPIO2	Full	None	RM_L4PER_GPIO2_CONTEXT[1] LOSTCONTEXT_RFF
GPIO3	Full	None	RM_L4PER_GPIO3_CONTEXT[1] LOSTCONTEXT_RFF
GPIO4	Full	None	RM_L4PER_GPIO4_CONTEXT[1] LOSTCONTEXT_RFF
GPIO5	Full	None	RM_L4PER_GPIO5_CONTEXT[1] LOSTCONTEXT_RFF
GPIO6	Full	None	RM_L4PER_GPIO6_CONTEXT[1] LOSTCONTEXT_RFF
HDQ	No	RM_L4PER_HDQ1W_CONTEXT[0] LOSTCONTEXT_DFF	None
I2C1	Full	None	RM_L4PER_I2C1_CONTEXT[1] LOSTCONTEXT_RFF
I2C2	No	RM_L4PER_I2C2_CONTEXT[0] LOSTCONTEXT_DFF	None
I2C3	No	RM_L4PER_I2C3_CONTEXT[0] LOSTCONTEXT_DFF	None
I2C4	No	RM_L4PER_I2C4_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_PER interconnect	Partial	RM_L4PER_L4_PER_CONTEXT[0] LOSTCONTEXT_DFF	RM_L4PER_L4_PER_CONTEXT[1] LOSTCONTEXT_RFF
MCBSP4	No	RM_L4PER_MCBSP4_CONTEXT[0] LOSTCONTEXT_DFF	None
MCSP1	No	RM_L4PER_MCSP1_CONTEXT[0] LOSTCONTEXT_DFF	None
MCSP2	No	RM_L4PER_MCSP2_CONTEXT[0] LOSTCONTEXT_DFF	None
MCSP3	No	RM_L4PER_MCSP3_CONTEXT[0] LOSTCONTEXT_DFF	None
MCSP4	No	RM_L4PER_MCSP4_CONTEXT[0] LOSTCONTEXT_DFF	None
HSMMC3	No	RM_L4PER_MMCS3_CONTEXT[0] LOSTCONTEXT_DFF	None
HSMMC4	No	RM_L4PER_MMCS4_CONTEXT[0] LOSTCONTEXT_DFF	None
HSMMC5	No	RM_L4PER_MMCS5_CONTEXT[0] LOSTCONTEXT_DFF	None

**Table 3-243. PD\_L4\_PER Modules Power Attributes (continued)**

Module	Logic Retention	DFF Context Status	RFF Context Status
SLIMBUS2	No	<a href="#">RM_L4PER_SLIMBUS2_CONTEXT[0] LOSTCONTEXT_DFF</a>	None
UART1	Full	None	<a href="#">RM_L4PER_UART1_CONTEXT[1] LOSTCONTEXT_RFF</a>

### 3.7.5.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

#### 3.7.5.1.1 Logic and Memory Area Power Modes

[Table 3-244](#) lists the power modes supported by the logic area of the power domain.

**Table 3-244. PD\_L4\_PER Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-245](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-245. PD\_L4\_PER Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
NONRETAINED_BANK		ON	OFF	OFF	
	MCBSP4 - MCBSP_BANK	always_on	always_off		None
	HSMC3 - MMCHSSRAM	always_on	always_off		None
	SLIMBUS2 - SLIMBUS_BANK	always_on	always_off		None
RETAINED_BANK		ON	RETENTION	OFF	
	UART1 - UART_MEM	always_on	always_retention		None

#### 3.7.5.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-246](#) lists the power modes controls for the power domain.

**Table 3-246. PD\_L4\_PER Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	NONRETAINED_BANK	<a href="#">PM_L4PER_PWRSTCTRL[9] NONRETAINED_BANK_RETSTATE</a>	Read only

**Table 3-246. PD\_L4\_PER Power Modes Control Parameters (continued)**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[8] RETAINED_BANK_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_L4PER_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Logic Area - Retention State Control		PM_L4PER_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	NONRETAINED_BANK	PM_L4PER_PWRSTCTRL[19: 18] NONRETAINED_BANK_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[17: 16] RETAINED_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_L4PER_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-247 lists the power modes status for the power domain.

**Table 3-247. PD\_L4\_PER Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_L4PER_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	NONRETAINED_BANK	PM_L4PER_PWRSTST[7:6] NONRETAINED_BANK_STATEST
Memory Area - State Status	RETAINED_BANK	PM_L4PER_PWRSTST[5:4] RETAINED_BANK_STATEST
Power Domain - State Transition Status		PM_L4PER_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_L4PER_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_L4PER_PWRSTST[1:0] POWERSTATEST

### 3.7.6 PD\_L3\_INIT Description

PD\_L3\_INIT contains the following reset domains:

- DPLL\_L3\_INIT\_PWRON\_RET\_RST
- L3\_INIT\_PWRON\_RST
- L3\_INIT\_RET\_RST
- L3\_INIT\_RST

PD\_L3\_INIT contains the CD\_L3\_INIT clock domain.

Table 3-248 lists the logic retention capability for each module of the power domain.

**Table 3-248. PD\_L3\_INIT Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
CM1_USB	No	None	None
DPLL_USB	Full	None	None
HSI	Full	None	RM_L3INIT_HSI_CONTEXT[1] LOSTCONTEXT_RFF
P1500	No	RM_L3INIT_P1500_CONTEXT [0] LOSTCONTEXT_DFF	None
HSMMC1	Full	None	RM_L3INIT_MMC1_CONTEXT [1] LOSTCONTEXT_RFF

**Table 3-248. PD\_L3\_INIT Modules Power Attributes (continued)**

Module	Logic Retention	DFP Context Status	RFF Context Status
HSMMC2	Full	None	<a href="#">RM_L3INIT_MMC2_CONTEXT[1] LOSTCONTEXT_RFF</a>
USBPHY	No	<a href="#">RM_L3INIT_USBPHY_CONTEXT[0] LOSTCONTEXT_DFF</a>	None
FSUSB	Full	None	<a href="#">RM_L3INIT_USB_HOST_FS_CONTEXT[1] LOSTCONTEXT_RFF</a>
HSUSBHOST	Full	None	<a href="#">RM_L3INIT_USB_HOST_CONTEXT[1] LOSTCONTEXT_RFF</a>
HSUSBOTG	Full	None	<a href="#">RM_L3INIT_USB_OTG_CONTEXT[1] LOSTCONTEXT_RFF</a>
HSUSBTLL	Full	None	<a href="#">RM_L3INIT_HSUSBTLL_CONTEXT[1] LOSTCONTEXT_RFF</a>

### 3.7.6.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

#### 3.7.6.1.1 Logic and Memory Area Power Modes

[Table 3-249](#) lists the power modes supported by the logic area of the power domain.

**Table 3-249. PD\_L3\_INIT Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-250](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-250. PD\_L3\_INIT Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
L3INIT_BANK1		ON	OFF	OFF	
	HSI - HSI_DMAFIFO	always_on	always_off		None
	HSMMC1 - HSMMCSRAM	always_on	always_off		None
	HSUSBOTG - USBMEM	always_on	always_off		always_enabled

#### 3.7.6.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-251](#) lists the power modes controls for the power domain.

**Table 3-251. PD\_L3\_INIT Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	L3INIT_BANK1	<a href="#">PM_L3INIT_PWRSTCTRL[8] L3INIT_BANK1_RETSTATE</a>	Read only
Power Domain - Low Power State Change Control		<a href="#">PM_L3INIT_PWRSTCTRL[4] LOWPOWERSTATECHANGE</a>	Read/Write

**Table 3-251. PD\_L3\_INIT Power Modes Control Parameters (continued)**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Logic Area - Retention State Control		PM_L3INIT_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[17:16] L3INIT_BANK1_ONSTATE	Read only
Power Domain - State Transition Control		PM_L3INIT_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-252 lists the power modes status for the power domain.

**Table 3-252. PD\_L3\_INIT Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_L3INIT_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	L3INIT_BANK1	PM_L3INIT_PWRSTST[5:4] L3INIT_BANK1_STATEST
Power Domain - State Transition Status		PM_L3INIT_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_L3INIT_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_L3INIT_PWRSTST[1:0] POWERSTATEST

### 3.7.7 PD\_IVAHD Description

PD\_IVAHD contains the following reset domains:

- IVAHD\_PWRON\_RST
- IVAHD\_RST
- IVAHD\_SEQ1\_RST
- IVAHD\_SEQ2\_RST

PD\_IVAHD contains the CD\_IVAHD clock domain.

Table 3-253 lists the logic retention capability for each module of the power domain.

**Table 3-253. PD\_IVAHD Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
IVAHD	No	RM_IVAHD_IVAHD_CONTEX T[0] LOSTCONTEXT_DFF	None
SL2	No	RM_IVAHD_SL2_CONTEXT[0] LOSTCONTEXT_DFF	None

#### 3.7.7.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

##### 3.7.7.1.1 Logic and Memory Area Power Modes

Table 3-254 lists the power modes supported by the logic area of the power domain.

**Table 3-254. PD\_IVAHD Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Not available	Available	Available

Table 3-255 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-255. PD\_IVAHD Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
HWA_MEM		ON	OFF	OFF	
	IVAHD - HWA_MEM	always_on	always_off		always_enabled
SL2_MEM		ON	OFF, RETENTION	OFF	
	SL2 - SL2MEM	always_on	software_control		always_enabled
TCM1_MEM		ON	OFF, RETENTION	OFF	
	IVAHD - TCM_1	always_on	software_control		always_enabled
TCM2_MEM		ON	OFF, RETENTION	OFF	
	IVAHD - TCM_2	always_on	software_control		always_enabled

### 3.7.7.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-256 lists the power modes controls for the power domain.

**Table 3-256. PD\_IVAHD Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	SL2_MEM	PM_IVAHD_PWRSTCTRL[9] SL2_MEM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	HWA_MEM	PM_IVAHD_PWRSTCTRL[8] HWA_MEM_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_IVAHD_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	TCM2_MEM	PM_IVAHD_PWRSTCTRL[23: 22] TCM2_MEM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	TCM1_MEM	PM_IVAHD_PWRSTCTRL[21: 20] TCM1_MEM_ONSTATE	Read only
Logic Area - Retention State Control		PM_IVAHD_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area - State Control (Logic in On state)	SL2_MEM	PM_IVAHD_PWRSTCTRL[19: 18] SL2_MEM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	HWA_MEM	PM_IVAHD_PWRSTCTRL[17: 16] HWA_MEM_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	TCM2_MEM	PM_IVAHD_PWRSTCTRL[11] TCM2_MEM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	TCM1_MEM	PM_IVAHD_PWRSTCTRL[10] TCM1_MEM_RETSTATE	Read/Write
Power Domain - State Transition Control		PM_IVAHD_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-257 lists the power modes status for the power domain.

**Table 3-257. PD\_IVAHD Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_IVAHD_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	TCM1_MEM	PM_IVAHD_PWRSTST[9:8] TCM1_MEM_STATEST

**Table 3-257. PD\_IVAHD Power Modes Status Parameters (continued)**

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	SL2_MEM	PM_IVAHD_PWRSTST[7:6] SL2_MEM_STATEST
Memory Area - State Status	HWA_MEM	PM_IVAHD_PWRSTST[5:4] HWA_MEM_STATEST
Power Domain - State Transition Status		PM_IVAHD_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_IVAHD_PWRSTST[2] LOGICSTATEST
Memory Area - State Status	TCM2_MEM	PM_IVAHD_PWRSTST[11:10] TCM2_MEM_STATEST
Power Domain - State Status		PM_IVAHD_PWRSTST[1:0] POWERSTATEST

### 3.7.8 PD\_SGX Description

PD\_SGX contains the SGX\_RST reset domain.

PD\_SGX contains the CD\_SGX clock domain.

Table 3-258 lists the logic retention capability for each module of the power domain.

**Table 3-258. PD\_SGX Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
SGX	No	RM_SGX_SGX_CONTEXT[0] LOSTCONTEXT_DFF	None

#### 3.7.8.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

##### 3.7.8.1.1 Logic and Memory Area Power Modes

Table 3-259 lists the power modes supported by the logic area of the power domain.

**Table 3-259. PD\_SGX Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Available	Available

Table 3-260 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-260. PD\_SGX Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	SGX - SGX_MEM	always_on	always_off		always_enabled

##### 3.7.8.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-261 lists the power modes controls for the power domain.

**Table 3-261. PD\_SGX Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - Low Power State Change Control		PM_SGX_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	SGX_MEM	PM_SGX_PWRSTCTRL[17:16] SGX_MEM_ONSTATE	Read only
Power Domain - State Transition Control		PM_SGX_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-262 lists the power modes status for the power domain.

**Table 3-262. PD\_SGX Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	SGX_MEM	PM_SGX_PWRSTST[5:4] SGX_MEM_STATEST
Power Domain - State Transition Status		PM_SGX_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_SGX_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_SGX_PWRSTST[1:0] POWERSTATEST

### 3.7.9 PD\_EMU Description

PD\_EMU contains the following reset domains:

- EMU\_EARLY\_PWRON\_RST
- EMU\_PWRON\_RST
- EMU\_RST

PD\_EMU contains the CD\_EMU clock domain.

Table 3-263 lists the logic retention capability for each module of the power domain.

**Table 3-263. PD\_EMU Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
CM1_EMU	No	None	None
DEBUG	No	None	None

### 3.7.9.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

#### 3.7.9.1.1 Logic and Memory Area Power Modes

Table 3-264 lists the power modes supported by the logic area of the power domain.

**Table 3-264. PD\_EMU Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Not available	Available

Table 3-265 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-265. PD\_EMU Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	DEBUG - DebugSS_MEM	always_on	always_off		always_enabled

### 3.7.9.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-266 lists the power modes controls for the power domain.

**Table 3-266. PD\_EMU Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in On state)	EMU_BANK	PM_EMU_PWRSTCTRL[17:16] ] EMU_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_EMU_PWRSTCTRL[1:0] POWERSTATE	Read only

Table 3-267 lists the power modes status for the power domain.

**Table 3-267. PD\_EMU Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	EMU_BANK	PM_EMU_PWRSTST[5:4] EMU_BANK_STATEST
Power Domain - State Transition Status		PM_EMU_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_EMU_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_EMU_PWRSTST[1:0] POWERSTATEST

## 3.7.10 PD\_DSS Description

PD\_DSS contains the following reset domains:

- DSS\_RET\_RST
- DSS\_RST

PD\_DSS contains the CD\_DSS clock domain.

Table 3-268 lists the logic retention capability for each module of the power domain.

**Table 3-268. PD\_DSS Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DSS	Partial	RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF

### 3.7.10.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

#### 3.7.10.1.1 Logic and Memory Area Power Modes

Table 3-269 lists the power modes supported by the logic area of the power domain.

**Table 3-269. PD\_DSS Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

Table 3-270 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-270. PD\_DSS Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
DSS_MEM		ON	OFF	OFF	
	DSS - DSSMEM	always_on	always_off		always_enabled

### 3.7.10.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-271 lists the power modes controls for the power domain.

**Table 3-271. PD\_DSS Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Logic Area - Retention State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only
Power Domain - State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-272 lists the power modes status for the power domain.

**Table 3-272. PD\_DSS Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain - State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

### 3.7.11 PD\_CORE Description

PD\_CORE contains the following reset domains:

- CM2\_PWRON\_RET\_RST
- CM2\_RET\_RST
- CORE\_PWRON\_RET\_RST
- CORE\_RET\_RST
- CORE\_RST
- DLL\_RST
- CORTEXM3\_PWRON\_RST
- CORTEXM3\_RET\_RST
- CORTEXM3\_RST1
- CORTEXM3\_RST2
- CORTEXM3\_RST3
- EMIF\_PWRON\_RST

- SDMA\_RET\_RST

PD\_CORE contains the following clock domains:

- CD\_C2C
- CD\_DMA
- CD\_CORTEXM3
- CD\_EMIF
- CD\_L3\_1
- CD\_L3\_2
- CD\_L3\_INSTR
- CD\_L4\_CFG

Table 3-273 lists the logic retention capability for each module of the power domain.

**Table 3-273. PD\_CORE Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
SYSCTRL_PADCONF_CORE	Full	None	None
CM2	Full	None	None
DDRPHY	No	None	None
SYSCTRL_GENERAL_CORE	Full	None	None
DLL	No	None	None
DMM	Partial	RM_MEMIF_DMM_CONTEXT[0] LOSTCONTEXT_DFF	RM_MEMIF_DMM_CONTEXT[1] LOSTCONTEXT_RFF
CORTEXM3	Partial	RM_MPU_M3_MPU_M3_CONTEXT[0] LOSTCONTEXT_DFF	RM_MPU_M3_MPU_M3_CONTEXT[1] LOSTCONTEXT_RFF
EMIF1	Full	RM_MEMIF_EMIF_1_CONTEXT[0] LOSTCONTEXT_DFF	RM_MEMIF_EMIF_1_CONTEXT[1] LOSTCONTEXT_RFF
EMIF2	Full	RM_MEMIF_EMIF_2_CONTEXT[0] LOSTCONTEXT_DFF	RM_MEMIF_EMIF_2_CONTEXT[1] LOSTCONTEXT_RFF
EMIF_FW	Partial	RM_MEMIF_EMIF_FW_CONTEXT[0] LOSTCONTEXT_DFF	RM_MEMIF_EMIF_FW_CONTEXT[1] LOSTCONTEXT_RFF
GPMC	Full	None	RM_L3_2_GPMC_CONTEXT[1] LOSTCONTEXT_RFF
SPINLOCK	Full	None	RM_L4CFG_SPINLOCK_CONTEXT[1] LOSTCONTEXT_RFF
L3_2 interconnect	Partial	RM_L3_2_L3_2_CONTEXT[0] LOSTCONTEXT_DFF	RM_L3_2_L3_2_CONTEXT[1] LOSTCONTEXT_RFF

L3_1 interconnect	Partial	RM_L3_1_L3_1_CONTEXT[0] LOSTCONTEXT_DFF	RM_L3_1_L3_1_CONTEXT[1] LOSTCONTEXT_RFF
L3_INSTR interconnect	No	RM_L3INSTR_L3_INSTR_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_CFG interconnect	Partial	RM_L4CFG_L4_CFG_CONTEXT[0] LOSTCONTEXT_DFF	RM_L4CFG_L4_CFG_CONTEXT[1] LOSTCONTEXT_RFF
Mailbox	Full	None	RM_L4CFG_MAILBOX_CONTEXT[1] LOSTCONTEXT_RFF
OCMC_RAM	No	RM_L3_2_OCMC_RAM_CONTEXT[0] LOSTCONTEXT_DFF	None
C2C	Partial	RM_C2C_C2C_CONTEXT[0] LOSTCONTEXT_DFF	RM_C2C_C2C_CONTEXT[1] LOSTCONTEXT_RFF
C2C_FW	Partial	RM_C2C_C2C_FW_CONTEXT[0] LOSTCONTEXT_DFF	RM_C2C_C2C_FW_CONTEXT[1] LOSTCONTEXT_RFF
SAR_ROM	No	RM_L4CFG_SAR_ROM_CONTEXT[0] LOSTCONTEXT_DFF	None

**Table 3-273. PD\_CORE Modules Power Attributes (continued)**

Module	Logic Retention	DFF Context Status	RFF Context Status
sDMA	Full	None	RM_SDMA_SDMA_CONTEXT[1] LOSTCONTEXT_RFF

### 3.7.11.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

#### 3.7.11.1.1 Logic and Memory Area Power Modes

[Table 3-274](#) lists the power modes supported by the logic area of the power domain.

**Table 3-274. PD\_CORE Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-275](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-275. PD\_CORE Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	logic off	RTA Feature
CORE_NRET_BANK		ON	OFF	OFF	
	DMM - DMM_MEMBANK2	always_on	always_off		None
CORE_OCMRAM		OFF, RETENTION, ON	OFF, RETENTION	OFF	
	OCMC_RAM - OCMC_RAM_Bank 1	software_control	software_control		always_enabled
CORE_OTHER_BANK		ON	RETENTION	OFF	
	sDMA - DMA_MEM	always_on	always_retention		None
	DMM - DMM_MEMBANK1	always_on	always_retention		always_enabled
MPU_M3_L2RAM		ON	OFF, RETENTION	OFF	
	CORTEXM3 - MPU_M3_L2RAM_MEM	always_on	software_control		always_enabled
MPU_M3_UNICACHE		ON	OFF, RETENTION	OFF	
	CORTEXM3 - MPU_M3_Unicode_mem	always_on	software_control		None

#### 3.7.11.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-276](#) lists the power modes controls for the power domain.

**Table 3-276. PD\_CORE Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[9] CORE_OCMRAM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[8] CORE_OTHER_BANK_RETSTATE	Read only
Memory Area - State Control (Logic in On state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[25:24] INTRCONN_NRET_BANK_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_M3_UNICACHE	PM_CORE_PWRSTCTRL[23:22] MPU_M3_UNICACHE_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_M3_L2RAM	PM_CORE_PWRSTCTRL[21:20] MPU_M3_L2RAM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL[19:18] CORE_OCMRAM_ONSTATE	Read/Write
Memory Area - State Control (Logic in On state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[17:16] CORE_OTHER_BANK_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[12] INTRCONN_NRET_BANK_RETSTATE	Read only
Memory Area - State Control (Logic in Retention state)	MPU_M3_UNICACHE	PM_CORE_PWRSTCTRL[11] MPU_M3_UNICACHE_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention)	MPU_M3_L2RAM	PM_CORE_PWRSTCTRL[10] MPU_M3_L2RAM_RETSTATE	Read/Write
Logic Area - Retention State Control	N/A	PM_CORE_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Power Domain - Low Power State Change Control	N/A	PM_CORE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Power Domain - State Transition Control	N/A	PM_CORE_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-277 lists the power modes status for the power domain.

**Table 3-277. PD\_CORE Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_CORE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	MPU_M3_L2RAM	PM_CORE_PWRSTST[9:8] MPU_M3_L2RAM_STATEST
Memory Area - State Status	CORE_OCMRAM	PM_CORE_PWRSTST[7:6] CORE_OCMRAM_STATEST
Memory Area - State Status	CORE_OTHER_BANK	PM_CORE_PWRSTST[5:4] CORE_OTHER_BANK_STATEST
Memory Area - State Status	CORE_NRET_BANK	PM_CORE_PWRSTST[13:12] INTRCONN_NRET_BANK_STATEST
Memory Area - State Status	MPU_M3_UNICACHE	PM_CORE_PWRSTST[11:10] MPU_M3_UNICACHE_STATEST
Logic Area - State Status		PM_CORE_PWRSTST[2] LOGICSTATEST
Power Domain - State Transition Status		PM_CORE_PWRSTST[20] INTRANSITION

**Table 3-277. PD\_CORE Power Modes Status Parameters (continued)**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - State Status		PM_CORE_PWRSTST[1:0] POWERSTATEST

**3.7.12 PD\_CAM Description**

PD\_CAM contains the CAM\_RST reset domain.

PD\_CAM contains the CD\_CAM clock domain.

Table 3-278 lists the logic retention capability for each module of the power domain.

**Table 3-278. PD\_CAM Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
FACE DETECT	No	RM_CAM_FDIF_CONTEXT[0] LOSTCONTEXT_DFF	None
ISS	No	RM_CAM_ISS_CONTEXT[0] LOSTCONTEXT_DFF	None

**3.7.12.1 Power Domain Modes**

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for functional description of the power-management architecture of a generic power domain.

**3.7.12.1.1 Logic and Memory Area Power Modes**

Table 3-279 lists the power modes supported by the logic area of the power domain.

**Table 3-279. PD\_CAM Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Available	Available

Table 3-280 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-280. PD\_CAM Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	FACE DETECT - FDIFMEM	always_on	always_off		always_enabled
	ISS - ISSMEM	always_on	always_off		always_enabled

**3.7.12.1.2 Logic and Memory Area Power Modes Control and Status**

Table 3-281 lists the power modes controls for the power domain.

**Table 3-281. PD\_CAM Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - Low Power State Change Control		PM_CAM_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	CAM_MEM	PM_CAM_PWRSTCTRL[17:16] ]CAM_MEM_ONSTATE	Read only

**Table 3-281. PD\_CAM Power Modes Control Parameters (continued)**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - State Transition Control		PM_CAM_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-282 lists the power modes status for the power domain.

**Table 3-282. PD\_CAM Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	CAM_MEM	PM_CAM_PWRSTST[5:4] CAM_MEM_STATEST
Power Domain - State Transition Status		PM_CAM_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_CAM_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_CAM_PWRSTST[1:0] POWERSTATEST

### 3.7.13 PD\_AUDIO Description

PD\_AUDIO contains the following reset domains:

- AUDIO\_PWRON\_RST
- AUDIO\_RST

PD\_AUDIO contains the CD\_ABE clock domain.

Table 3-283 lists the logic retention capability for each module of the power domain.

**Table 3-283. PD\_AUDIO Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
AUDIO ENGINE	No	RM_ABE_AESS_CONTEXT[0] LOSTCONTEXT_DFF	None
CM1_ABE	No	None	None
DMIC	No	RM_ABE_DMIC_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_ABE interconnect	No	None	None
MCASP1	No	RM_ABE_MCASP_CONTEXT[0] LOSTCONTEXT_DFF	None
MCBSP1	No	RM_ABE_MCBSP1_CONTEXT[0] LOSTCONTEXT_DFF	None
MCBSP2	No	RM_ABE_MCBSP2_CONTEXT[0] LOSTCONTEXT_DFF	None
MCBSP3	No	RM_ABE_MCBSP3_CONTEXT[0] LOSTCONTEXT_DFF	None
MCPDM	No	RM_ABE_PDM_CONTEXT[0] LOSTCONTEXT_DFF	None
SLIMBUS1	No	RM_ABE_SLIMBUS_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER5	No	RM_ABE_GPTIMER5_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER6	No	RM_ABE_GPTIMER6_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER7	No	RM_ABE_GPTIMER7_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER8	No	RM_ABE_GPTIMER8_CONTEXT[0] LOSTCONTEXT_DFF	None
WDTIMER3	No	RM_ABE_WDTIMER3_CONTEXT[0] LOSTCONTEXT_DFF	None

### 3.7.13.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

#### 3.7.13.1.1 Logic and Memory Area Power Modes

[Table 3-284](#) lists the power modes supported by the logic area of the power domain.

**Table 3-284. PD\_AUDIO Logic Area Power Modes**

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Not available	Available	Available

[Table 3-285](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

**Table 3-285. PD\_AUDIO Memory Area Power Modes**

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
AESSMEM		ON	RETENTION	OFF	
	AUDIO ENGINE - AESS_MemBank1	always_on	always_retention		always_enabled
PERIPHEM		ON	OFF	OFF	
	DMIC - DMIC_BANK	always_on	always_off		None
	MCBSP1 - MCBSP_BANK	always_on	always_off		None
	MCPDM - MCPDM_BANK	always_on	always_off		None
	SLIMBUS1 - SLIMBUS_BANK	always_on	always_off		None

#### 3.7.13.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-286](#) lists the power modes controls for the power domain.

**Table 3-286. PD\_AUDIO Power Modes Control Parameters**

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	AESSMEM	PM_ABE_PWRSTCTRL[8] AESSMEM_RETSTATE	Read only
Memory Area - State Control (Logic in On state)	PERIPHEM	PM_ABE_PWRSTCTRL[21:20] PERIPHEM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	AESSMEM	PM_ABE_PWRSTCTRL[17:16] AESSMEM_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	PERIPHEM	PM_ABE_PWRSTCTRL[10] PERIPHEM_RETSTATE	Read only
Logic Area - Retention State Control		PM_ABE_PWRSTCTRL[2] LOGICRETSTATE	Read only
Power Domain - Low Power State Change Control		PM_ABE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Power Domain - State Transition Control		PM_ABE_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-287 lists the power modes status for the power domain.

**Table 3-287. PD\_AUDIO Power Modes Status Parameters**

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_ABE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	PERIPHMEM	PM_ABE_PWRSTST[9:8] PERIPHMEM_STATEST
Memory Area - State Status	AESSMEM	PM_ABE_PWRSTST[5:4] AESSMEM_STATEST
Power Domain - State Transition Status		PM_ABE_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_ABE_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_ABE_PWRSTST[1:0] POWERSTATEST

### 3.7.14 PD\_ALWON\_MPU Description

PD\_ALWON\_MPU contains the following reset domains:

- ALWON\_MPU\_RST
- DPLL\_MPU\_PWRON\_RST

PD\_ALWON\_MPU has no associated clock domains.

Table 3-288 lists the logic retention capability for each module of the power domain.

**Table 3-288. PD\_ALWON\_MPU Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None
CORTEXA9_MPU_INTC	No	None	None

#### 3.7.14.1 Power Domain Modes

The PD\_ALWON\_MPU power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD\_ALWON\_MPU power domain has no memory banks.

### 3.7.15 PD\_ALWON\_DSP Description

PD\_ALWON\_DSP contains the following reset domains:

- ALWON\_IVA\_RST
- DPLL\_IVA\_PWRON\_RST

PD\_ALWON\_DSP has no clock domains associated.

Table 3-289 lists the logic retention capability for each module of the power domain.

**Table 3-289. PD\_ALWON\_DSP Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_IVA	No	None	None
DSP_WKUPGEN	No	None	None

#### 3.7.15.1 Power Domain Modes

The PD\_ALWON\_DSP power domain is an always-on power domain and does not switch to retention state. There is no logic power state control or status bit field for this power domain.

The PD\_ALWON\_DSP power domain has no memory banks.

### 3.7.16 PD\_ALWON\_CORE Description

PD\_ALWON\_CORE contains the following reset domains:

- ALWON\_CM1\_PWRON\_RST
- ALWON\_CM1\_RST
- ALWON\_CORE\_PWRON\_RST
- ALWON\_CORE\_RST

PD\_ALWON\_CORE contains the following clock domains:

- CD\_ALWON\_CM
- CD\_L4\_ALWON\_CORE

Table 3-290 lists the logic retention capability for each module of the power domain.

**Table 3-290. PD\_ALWON\_CORE Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
CM1	No	None	None
DPLL_ABE	No	None	None
DPLL_CORE	No	None	None
DPLL_PER	No	None	None
CORTEXM3_WKUPGEN	No	None	None
SDMA_WKUPGEN	No	None	None
SR_CORE	No	<a href="#">RM_ALWON_SR_CORE_CONTEXT[0] LOSTCONTEXT_DFF</a>	None
SR_IVA	No	<a href="#">RM_ALWON_SR_IVA_CONTEXT[0] LOSTCONTEXT_DFF</a>	None
SR_MPU	No	<a href="#">RM_ALWON_SR_MPU_CONTEXT[0] LOSTCONTEXT_DFF</a>	None
SPINNER	No	None	None

#### 3.7.16.1 Power Domain Modes

The PD\_ALWON\_CORE power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD\_ALWON\_CORE power domain has no memory banks.

### 3.8 Voltage Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

#### 3.8.1 Overview

The voltage management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see [Section 3.1.1.3, Voltage Management](#)). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD\_CORE\_L
- VDD\_MPU\_L
- VDD\_IVA\_L
- LDO\_CORE\_M
- LDO\_IVA\_M
- LDO\_MPU\_M
- LDO\_IVA\_ABB
- LDO\_MPU\_ABB
- LDO\_WAKEUP

---

**NOTE:** See [Table 3-24](#) for device power supply pin association to the power domain.

---

The PRCM module supports the AVS technique on the VDD\_MPU\_L, VDD\_CORE\_L and VDD\_IVA\_L voltage domains, through automatic monitoring and adjustments of voltages by their dedicated SmartReflex modules. The VDD\_MPU\_L and VDD\_IVA\_L voltage domains support five DVFS OPPs. The VDD\_CORE\_L voltage domain supports three DVFS OPPs.

The PRCM module also supports ABB technique on the MPU and IVA voltage domains, through the LDO\_MPU\_ABB and LDO\_IVA\_ABB biasing voltages.

The PRCM module automatically scales down the LDO\_MPU\_M, LDO\_CORE\_M, and LDO\_IVA\_M to retention voltage level whenever all memory banks on these domain have transitioned to the RETENTION or OFF power state.

#### 3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- Voltage processors for converting SmartReflex data to voltage values before sending to the voltage controller
- Voltage FSMs for hardware control of voltages. They either send commands to the voltage controller (I<sup>2</sup>C mode).
- A voltage controller for gathering commands from the PRCM module register (direct access), voltage processors and voltage PRCMs. It then handles communication with the external power IC through the dedicated I<sup>2</sup>C interface.
- A device PRCM for managing the voltage PRCMs and I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management and WAKEUP logic.
- Bandgap reference voltage sleep control

---

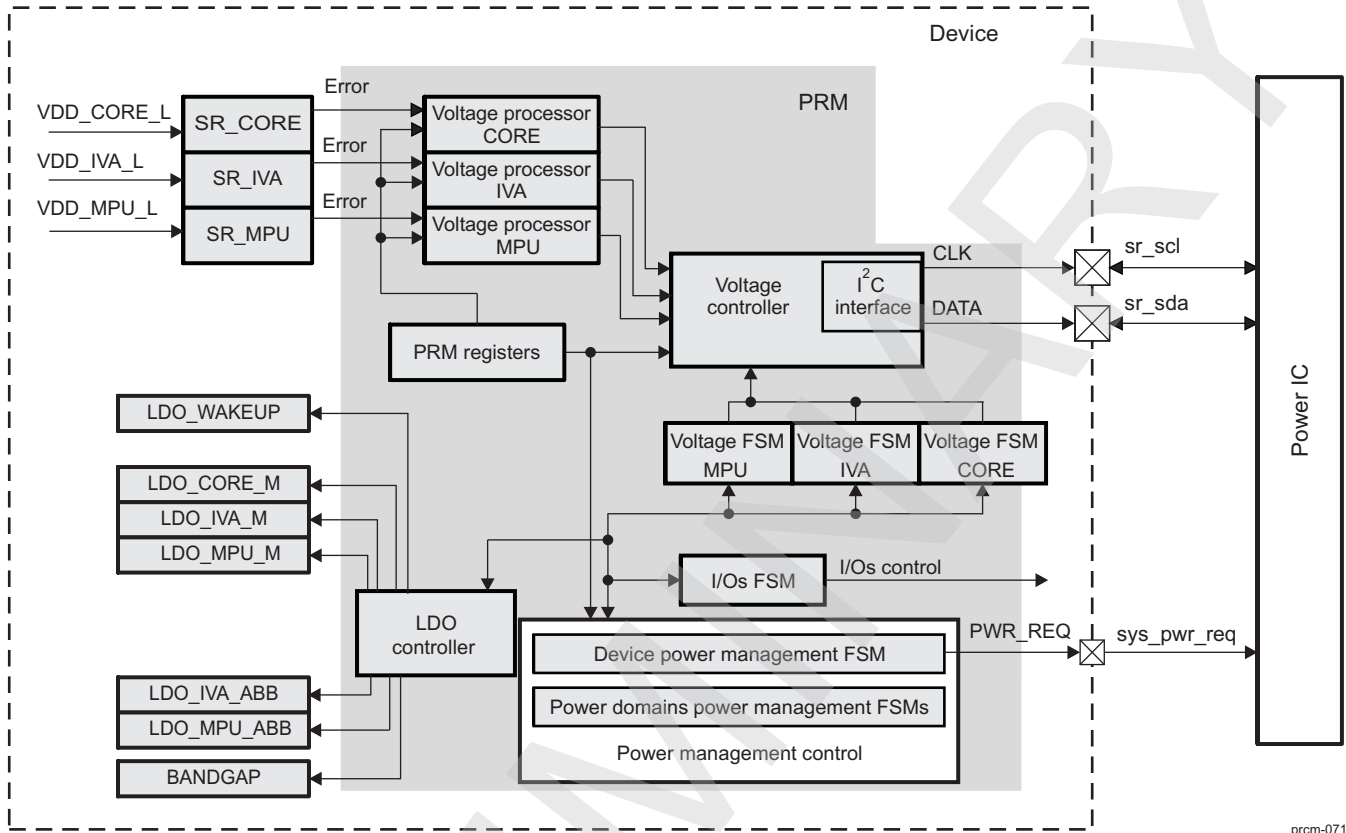

**NOTE:** The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching of the voltage domain to RETENTION or OFF level when all power domains within the power domain are in RETENTION or OFF power states. This is handled by the voltage PRCMs.

---

Figure 3-69 shows the architecture for PRM voltage control.

Figure 3-69. PRM Voltage Control Architecture

prcm-071

### 3.8.3 VDD\_MPU\_L, VDD\_CORE\_L, and VDD\_IVA\_L Control

These power supply sources can be controlled using PRM dedicated I<sup>2</sup>C control.

#### 3.8.3.1 PRM Dedicated I<sup>2</sup>C Control

The PRM I<sup>2</sup>C interface is dedicated to SmartReflex voltage control. It enables the voltage controller to send voltage commands to the external power IC. To reduce latency of voltage changes, the voltage controller is configurable to run in HS I<sup>2</sup>C mode. The PRM I<sup>2</sup>C interface supports multimaster mode.

The voltage controller receives voltage control commands from following input ports:

- Voltage processors ports: Each voltage processor sends voltage change commands to the voltage controller depending on the information received from the associated SmartReflex module.
- Voltage PRCMs ports: Each voltage PRCM sends commands to the voltage controller when the device enters RETENTION or OFF power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the external voltage sources.

An arbitration scheme in the voltage controller manages concurrent requests on different ports.

Each internal port has a handshake to indicate when the I<sup>2</sup>C frame resulting from the request on that port has been acknowledged by the external Power IC.

The PRM can also send external voltage source sleep commands that can be used to activate power IC sleep mode, where the voltage regulator maintains output voltage but only a small load is supported. This lets the external power IC reduce its power consumption as well.

**NOTE:** An I<sup>2</sup>C interface not controlled by the PRM can be used to program voltage levels of the external power IC. Because it is not a hardware-controlled interface its use is restricted to move the voltage level from one OPP to another.

In this case, the control software must operate voltage transition when the device activity allows one.

### 3.8.3.2 Adaptive Voltage Scaling

As explained in [Section 3.1.2.4, Adaptive Voltage Scaling](#), SmartReflex is a technology that uses adaptive power supply to achieve the goal of reducing active power consumption. With SmartReflex, the power supply voltage can be adapted to the silicon performance either statically (for example, adapted to the manufacturing process of a given device), or dynamically (for example, adapted to the temperature-induced current performance of the device).

SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller with dedicated I<sup>2</sup>C interface, which are shared with the voltage PRCM modules and voltage control registers.

The SmartReflex modules allow a continuous real-time monitoring of voltage supply and device performance to do the following:

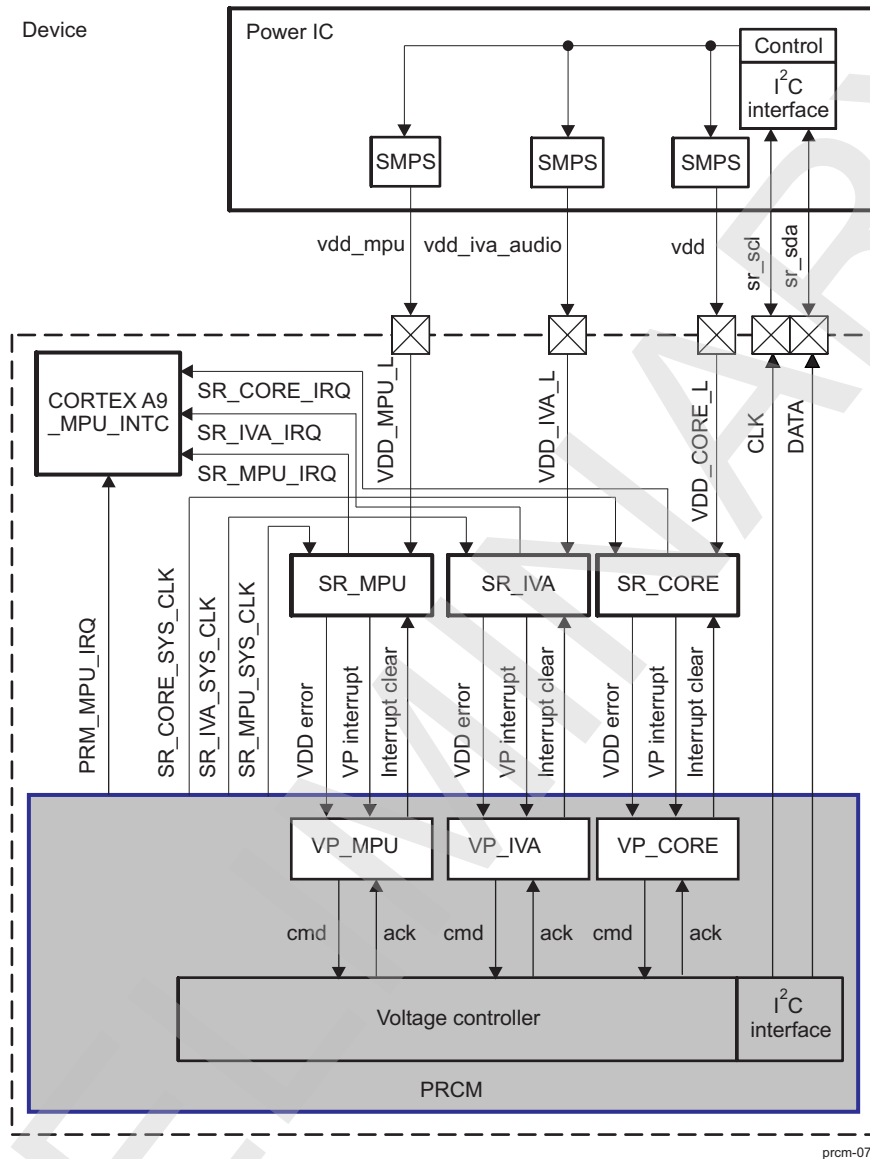

- Minimize the supply voltage to reduce the device power consumption.
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies.

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

#### 3.8.3.2.1 SmartReflex in the Device

[Figure 3-70](#) shows the SmartReflex integration.

Figure 3-70. SmartReflex Integration

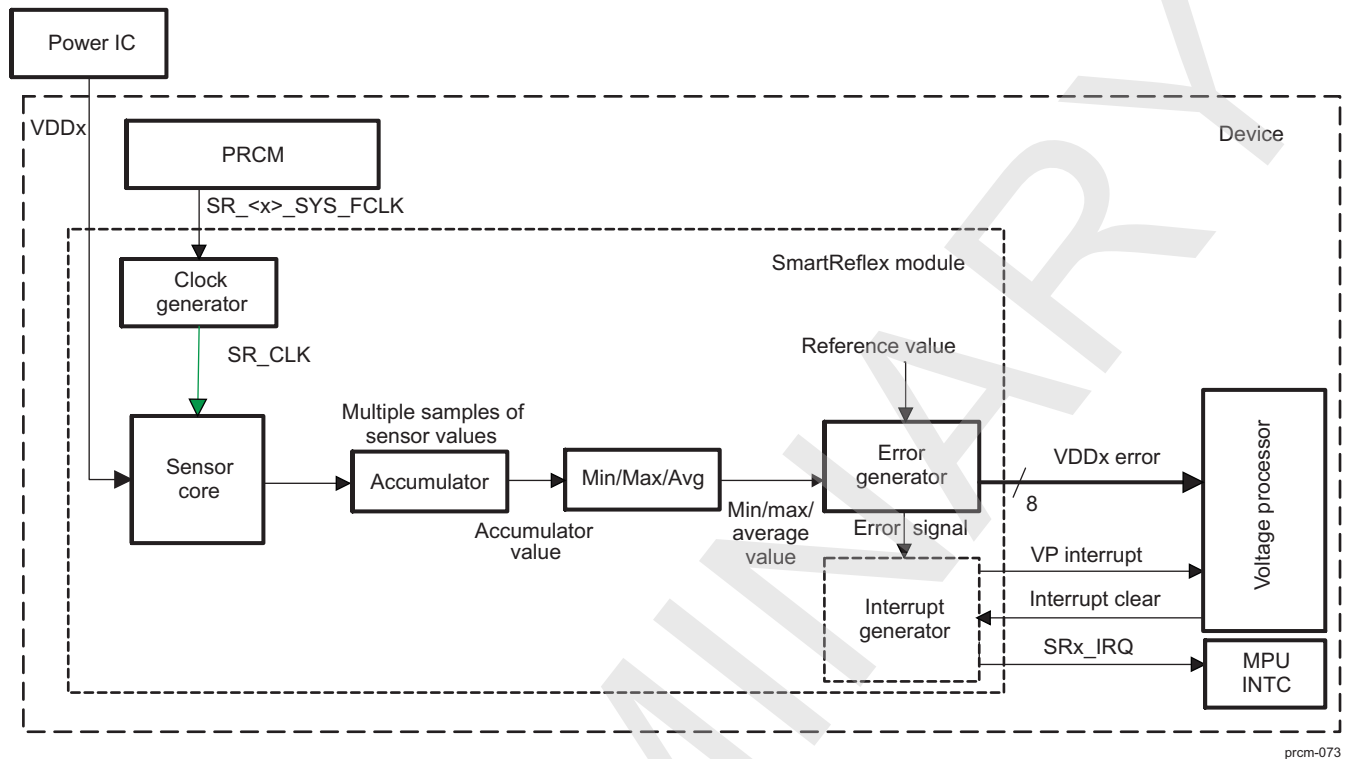

SmartReflex voltage control in the device is implemented for simultaneous control of three independent voltage sources. One SmartReflex module controls the VDD\_CORE\_L voltage, the second one is dedicated to VDD\_IVA\_L control, and the third controls the VDD\_MPU\_L voltage. Each SmartReflex module is connected to a voltage processor. Voltage commands from all voltage processors are passed to a voltage control, which sends them through a dedicated I<sup>2</sup>C master interface to the power IC.

SmartReflex modules are in the PD\_ALWON\_CORE power domain and supplied by the VDD\_CORE\_L voltage domain. Each module senses its own voltage domain (VDD\_CORE\_L, VDD\_IVA\_L, or VDD\_MPU\_L).

### 3.8.3.2.2 SmartReflex Module

Figure 3-71 is a functional overview of the SmartReflex module.

**Figure 3-71. SmartReflex Module Functional Overview**

### 3.8.3.2.3 SmartReflex Submodules

**NOTE:** In this and following section SR<sub>n</sub> refers to SR\_IVA, SR\_MPU, and SR\_CORE SmartReflex modules.

The SmartReflex module is enabled by setting the SR<sub>n</sub>.SRCONFIG[11] SR\_EN bit. The SmartReflex module is composed of six blocks:

- Clock generator
- Sensor core
- Accumulator
- Minimum/maximum/average
- Error generator
- Interrupt generator

#### Clock Generator

The clock generator provides the internal SR\_CLK sampling clock to the sensor core of the module. The SR<sub>n</sub>.SRCONFIG[21:12] SRCLKLENGTH bit field allows the setting of the frequency divider ratio between the <SRn>\_SYS\_CLK and the SR\_CLK. It is calculated using Equation 1:

$$\text{SR}_n.\text{SRCONFIG}[21:12] \text{ SRCLKLENGTH} = f_{\text{<SRn>_SYS\_CLK}} / (2^* f_{\text{SR\_CLK}}) \quad (1)$$

Where  $f_{\text{<SRn>_SYS\_CLK}}$  is the frequency of the <SRn>\_SYS\_CLK, and  $f_{\text{SR\_CLK}}$  is the desired SR\_CLK frequency.

To accurately use the target values programmed for SmartReflex modules in the device, the SRCLKLENGTH parameter must be set correctly. The target values for the SmartReflex modules are calculated with the SR\_CLK frequency set at 100 kHz. It is thus mandatory that the value of the SRCLKLENGTH parameter is calculated from Equation 1-1 with  $f_{\text{SR\_CLK}}$  set at 100 kHz.

For example, if the system clock has a frequency of 38.4 MHz, and the target SR\_CLK frequency is 100 kHz, the SRn.SRCONFIG[21:12] SRCLKLENGTH bit field is 192 (0x0C0).

### **Sensor Core**

The sensor core receives the SR\_CLK sampling clock and the voltage to be sensed. It generates sensor value samples proportional to the voltage sensed. For accuracy, a sensor core is composed of two sensors and generates two values per sample (one from each sensor).

The two sample values generated by the sensor core output can be read from the SRn.SENVAL[15:0] SENNVAL and SRn.SENVAL[31:16] SENPVAL bit fields.

The sensor core is enabled by the SRn.SRCONFIG[10] SENENABLE bit.

### **Accumulator**

The accumulator consists of two stacks that store multiple samples of the two sensor values received from the sensor core.

The SRn.SRCONFIG[31:22] ACCUMDATA bit field defines the size of the accumulator in the number of samples to be stored. The allowable range is from 2 to 1023. The value of SRn.SRCONFIG[31:22] ACCUMDATA value is related to the desired sampling time window ( $T_{\text{TimeWindow}}$ ) and the SR\_CLK frequency ( $f_{\text{SR\_CLK}}$ ). It can be calculated using [Equation 2](#):

$$\text{SRn.SRCONFIG[31:22] ACCUMDATA} = T_{\text{TimeWindow}} * f_{\text{SR\_CLK}} \quad (2)$$

For example, for an accumulator time window of 10 ms and SR\_CLK frequency of 32 kHz, the value of SRn.SRCONFIG[31:22] ACCUMDATA is 320 (0x140). The accumulation window must be large enough so that the minimum, maximum, and average counter values are accurate.

### **Minimum/Maximum/Average**

The minimum/maximum/average block reads the samples stored in the accumulator and returns the minimum, maximum, and average values of the samples. Because the accumulator contains two separate groups of samples (one from each sensor of the sensor core), the minimum/maximum/average block also generates two sets of minimum, maximum, and average values.

The minimum, maximum, and average values of the samples of the first sensor can be read from the SRn.SENMIN[15:0] SENNMIN, SRn.SENMAX[15:0] SENNMAX, and SRn.SENAVG[15:0] SENNAVG bit fields.

For the sample values of the second sensor, the minimum, maximum, and average values can be read from the SRn.SENMIN[31:16] SENPMIN, SRn.SENMAX[31:16] SENPMAX, and SRn.SENAVG[31:16] SENPAVG bit fields.

The minimum/maximum/average block is enabled by the SRn.SRCONFIG[8] MINMAXAVGENABLE bit.

### **Error Generator**

The error generator block reads the sample value generated by the sensor core and compares it with a reference value to calculate the error. This error is then passed to the voltage processor and the internal interrupt generator block.

The reference value for a given OPP of the device is configured by setting the SRn.NVALUERECIPROCAL[23:20] SENPGAIN, SRn.NVALUERECIPROCAL[19:16] SENNGAIN, SRn.NVALUERECIPROCAL[15:8] RSENPN, and SRn.NVALUERECIPROCAL[7:0] RSENENN bit fields by reading corresponding values from the eFuses (see [Section 3.8.3.2.5, SmartReflex Parameters Set After Silicon Characterization](#)).

The error generator sets the SRn.SRSTATUS[1] ERRGEN\_VALID status bit when a valid error value is set in the SRn.SENERROR register.

The SRn.SENERROR register contains the average error (SRn.SENERROR[15:8] AVGERROR) and the percentage of error (SRn.SENERROR[7:0] SENERROR).

The error generator block is enabled by the SRn.SRCONFIG[9] ERRORGENERATORENABLE bit.

### **Interrupt Generator**

The interrupt generator block generates interrupts to the MPU INTC and the voltage processor module (if the corresponding interrupts are enabled) to indicate errors.

Table 3-291 and Table 3-292 list the interrupt events in the SmartReflex module and their enable and status bits.

**Table 3-291. SmartReflex Interrupt Events**

Interrupt Type	Description
Accumulator	The minimum/maximum/average module has completed computation over the accumulator data.
Valid	The average error is less than 2 percent of the true average error.
Disable acknowledge	The SmartReflex module is disabled and has cleared all MPU INTC and VP interrupts (internal registers are reset). This interrupt indicates to the software that the SmartReflex module is available for programming.
Bounds	The frequency error has crossed the maximum limit (ERRMAXLIMIT) or the minimum limit (ERRMINLIMIT). It is mapped to the voltage processor also.

The SRn\_CORTEX\_M3\_IRQs from SR\_IVA and SR\_CORE are mapped to the MM\_IRQ\_47 interrupt line of the CORTEXM3\_MPU\_INTC.

**Table 3-292. SmartReflex Interrupt Events Enable and Status Bits**

Interrupt Type	Enable Bit	Status Bit
Accumulator	SRn.IRQENABLE_SET[3] MCUACCUMINTENSET	SRn.IRQSTATUS[3] MCUACCUMINTSTATENA
	SRn.IRQENABLE_CLR[3] MCUACCUMINTENCLR	
Valid	SRn.IRQENABLE_SET[2] MCUVALIDINTENSET	SRn.IRQSTATUS[2] MCUVALIDINTSTATENA
	SRn.IRQENABLE_CLR[2] MCUVALIDINTENCLR	
Disable acknowledge	SRn.IRQENABLE_SET[0] MCUDISABLEACKINTENSET	SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA
	SRn.IRQENABLE_CLR[0] MCUDISABLEACKINTENCLR	
Bounds	SRn.IRQENABLE_SET[1] MCUBOUNDSINTENSET	SRn.IRQSTATUS[1] MCUBOUNDSINTSTATENA
	SRn.IRQENABLE_CLR[1] MCUBOUNDSINTENCLR	
	SRn.ERRCONFIG[22] VPBOUNDSINTENABLE	SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA

The minimum and maximum error limits for the bounds interrupt are configured in the SRn.ERRCONFIG[15:8] ERRMAXLIMIT and SRn.ERRCONFIG[7:0] ERRMINLIMIT bit fields.

With automatic (also called hardware or Class-3) voltage control, the voltage processor interrupt (SRn.ERRCONFIG[31] VPBOUNDINTEN) is enabled and the SmartReflex module interrupts the voltage processor when the error crosses the error limits. In this case, the CORTEXM3 interrupts can also be enabled to allow software to monitor the behavior of the SmartReflex module.

With manual (also called software or Class-2) voltage control, the voltage processor interrupt remains disabled and only the CORTEXM3 interrupts are enabled. Thus, when an interrupt condition occurs, the CORTEXM3 is interrupted and software can then control the voltage by generating voltage commands.

Writing 1 to a bit in the IRQSTATUS register clears the interrupt pending status of each interrupt source whose corresponding bit is 1 in the value written. Other interrupt pending status bits are not affected (writing 0 to that bit does not affect the status).

### 3.8.3.2.4 Status Register

The status register (**SRSTATUS**) indicates the validity of the minimum/maximum/average and error generator output values.

**SRSTATUS** has the following bits and bit fields:

- **SRn.SRSTATUS[3] AVGERVALID**: Indicates the validity of the value in the **SRn.SENERROR\_REG[15:8] AVGERROR** bit field. When the value is 0, the average error is not valid. When the value is 1, the average error is within 2 percent of the valid average error.
- **SRn.SRSTATUS[2] MINMAXAVGVALID**: Indicates the validity of the **SRn.SENVAL**, **SRn.SENMIN**, **SRn.SENMAX**, and **SRn.SENAVG** registers. When the value is 0, the registers are not valid. When the value is 1, the registers contain valid values, although the values are not necessarily fully accumulated.
- **SRn.SRSTATUS[1] ERRGEN\_VALID**: Indicates the validity of the value in the **SRn.SENERROR\_REG[7:0] SENERROR** bit field. When the value is 0, the error value is invalid. When the value is 1, the error value is valid.
- **SRn.SRSTATUS[0] MINMAXAVGACCUMVALID**: Indicates that the **SRn.SENVAL**, **SRn.SENMIN**, **SRn.SENMAX**, and **SRn.SENAVG** registers contain their final values accumulated over the defined sample time period.

### 3.8.3.2.5 SmartReflex Parameters Set After Silicon Characterization

Certain parameters of the SmartReflex module are characterized and calibrated after silicon testing. These values are then either set in the eFuse farm of the device or provided separately. Users must configure these parameters according to their given values to ensure correct functioning of the module.

The values for the following parameters (explained in [Section 3.8.3.2.3, SmartReflex Submodules](#)) are set in the device eFuse after device silicon characterization:

- **SRn.SRCONFIG[6:5] SENNENABLE**
- **SRn.SRCONFIG[4:3] SENPENABLE**
- **SRn.NVALUERECPROCAL[23:20] SENPGAIN**
- **SRn.NVALUERECPROCAL[19:16] SENNGAIN**
- **SRn.NVALUERECPROCAL[15:8] RNSENP**
- **SRn.NVALUERECPROCAL[7:0] RNSENN**

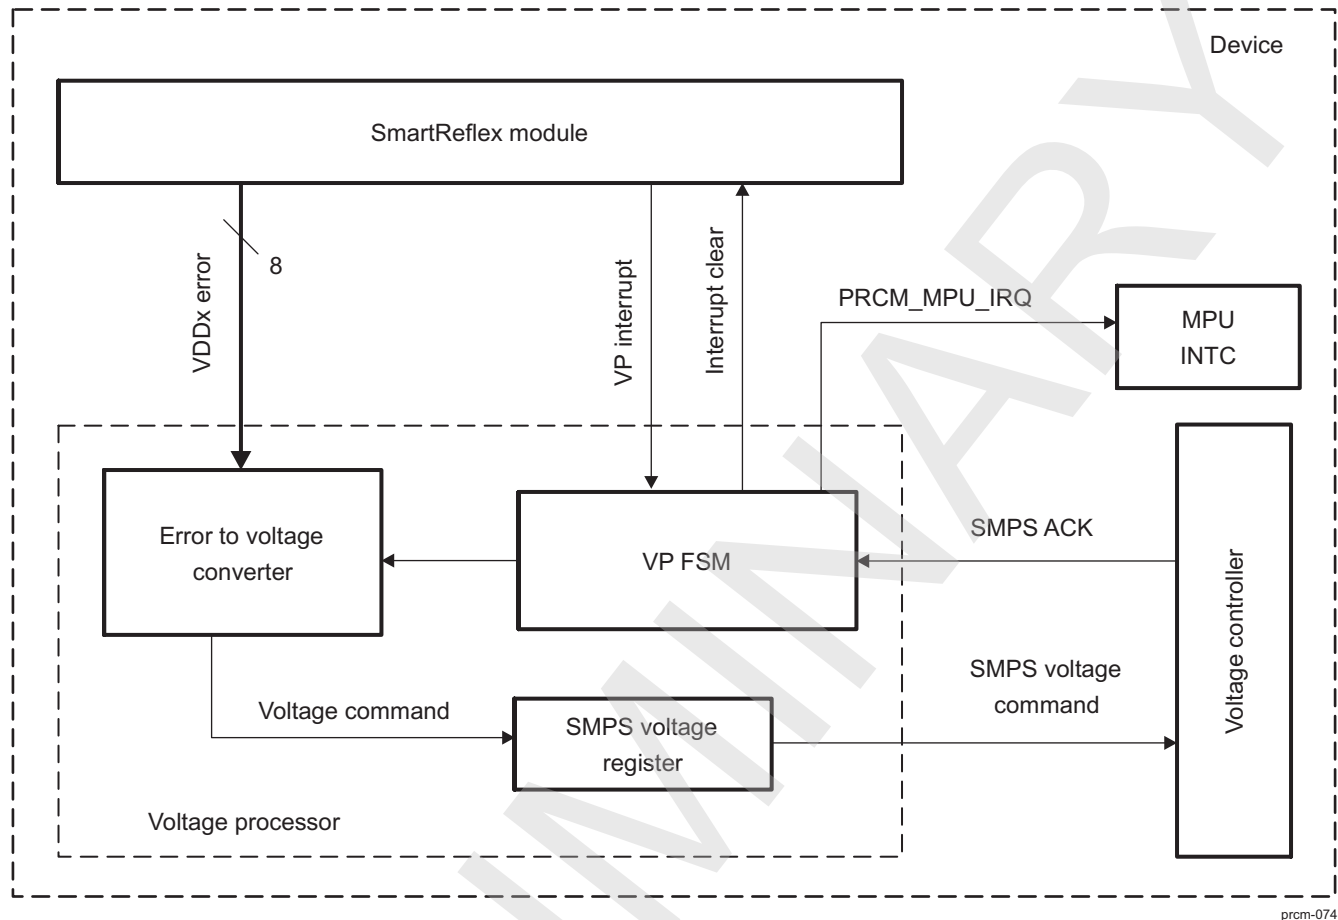

The eFuse values of these parameters must be read from the corresponding registers of the control module.

Information about the following parameters of the SmartReflex module is provided after silicon characterization:

- **SRn.AVGWEIGHT[3:2] SENPAVGWEIGHT**
- **SRn.AVGWEIGHT[1:0] SENNAVGWEIGHT**
- **SRn.ERRCONFIG[18:16] ERRWEIGHT**
- **SRn.ERRCONFIG[15:8] ERRMAXLIMIT**
- **SRn.ERRCONFIG[7:0] ERRMINLIMIT**

### 3.8.3.2.6 Voltage Processor Module

[Figure 3-72](#) is a functional overview of the voltage processor.

**Figure 3-72. Voltage Processor Functional Overview**

The voltage processor receives an error value and a VP interrupt signal from the SmartReflex module. Each time a new error value is sent, the SmartReflex module triggers an interrupt to inform the voltage processor. The voltage processor consists of an error-to-voltage command converter and a state controller. It processes an error and sends a voltage command to the voltage controller. It receives an acknowledge signal from the voltage controller when the SMPS receives the command. The voltage processor then acknowledges the SmartReflex module by clearing its interrupt.

The voltage processor is enabled by the PRM\_VPn\_CONFIG[0] VPENABLE bit.

### **Voltage Processor Interrupts**

The voltage processor uses the PRCM\_CORTEXM3\_MPU\_IRQ (MM\_IRQ\_46 of CORTEXM3\_MPU\_INTC) interrupt line of the CORTEXM3. [Table 3-293](#) and [Table 3-294](#) list the interrupt events in the voltage processor module and their enable and status bits.

**Table 3-293. Voltage Processor Interrupt Events**

Interrupt Type	Description
Transaction done	Voltage processor transaction is complete.
Equal value	Voltage requested in the new voltage command is the same as the current SMPS voltage.
No SMPS acknowledge	SMPS has not responded in a defined time interval to the transmitted voltage command.
Maximum VDD	New voltage requested in the voltage command is equal to or greater than maximum VDD.
Minimum VDD	New voltage requested in the voltage command is equal to or less than minimum VDD.
OPP change done	The average error is within the desired limit.

**NOTE:** Transaction done and OPP change done interrupt events are generated under the same conditions (after voltage change).

**Table 3-294. Voltage Processor Interrupt Event Enable and Status Bits**

Interrupt Type	Enable Bit	Status Bit
Transaction done	PRM_IRQENABLE_MPU_M3[21] VP_CORE_TRANXDONE_EN	PRM_IRQSTATUS_MPU_M3[21] VP_CORE_TRANXDONE_ST
	PRM_IRQENABLE_MPU_M3[29] VP_IVA_TRANXDONE_EN	PRM_IRQSTATUS_MPU_M3[29] VP_IVA_TRANXDONE_ST
Equal value	PRM_IRQENABLE_MPU_M3[20] VP_CORE_EQVALUE_EN	PRM_IRQSTATUS_MPU_M3[20] VP_CORE_EQVALUE_ST
	PRM_IRQENABLE_MPU_M3[28] VP_CORE_EQVALUE_EN	PRM_IRQSTATUS_MPU_M3[28] VP_IVA_EQVALUE_ST
No SMPS acknowledge	PRM_IRQENABLE_MPU_M3[19] VP_CORE_NOSMPSACK_EN	PRM_IRQSTATUS_MPU_M3[19] VP_CORE_NOSMPSACK_ST
	PRM_IRQENABLE_MPU_M3[27] VP_IVA_NOSMPSACK_EN	PRM_IRQSTATUS_MPU_M3[27] VP_IVA_NOSMPSACK_ST
Maximum VDD	PRM_IRQENABLE_MPU_M3[18] VP_CORE_MAXVDD_EN	PRM_IRQSTATUS_MPU_M3[18] VP_CORE_MAXVDD_ST
	PRM_IRQENABLE_MPU_M3[26] VP_IVA_MAXVDD_EN	PRM_IRQSTATUS_MPU_M3[26] VP_IVA_MAXVDD_ST
Minimum VDD	PRM_IRQENABLE_MPU_M3[17] VP_CORE_MINVDD_EN	PRM_IRQSTATUS_MPU_M3[17] VP_CORE_MINVDD_ST
	PRM_IRQENABLE_MPU_M3[25] VP_IVA_MINVDD_EN	PRM_IRQSTATUS_MPU_M3[25] VP_IVA_MINVDD_ST
OPP change done	PRM_IRQENABLE_MPU_M3[16] VP_CORE_OPPCHANGEDONE_EN	PRM_IRQSTATUS_MPU_M3[16] VP_CORE_OPPCHANGEDONE_ST
	PRM_IRQENABLE_MPU_M3 [24] VP_IVA_OPPCHANGEDONE_EN	PRM_IRQSTATUS_MPU_M3[24] VP_IVA_OPPCHANGEDONE_ST

### Voltage Processor Status

The status of the voltage processor is represented by the following:

Bit/Bit Field	Parameter	Description
PRCM.module.PRM_VPn_VOLTAGE[7:0] VPVOLTAGE	Current voltage for SMPS	Value of the current voltage level requested by the voltage processor
PRCM.module.PRM_VPn_STATUS[0] VPINIDLE	Voltage processor in INACTIVE state	The voltage processor is in idle mode.

### Voltage Processor Parameters

The following parameters of the voltage processor must be configured:

Bit/Bit Field	Parameter	Description
PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET	Error offset	Error in voltage offset value
PRCM.PRM_VPn_CONFIG[231:16] ERRORGAIN	Error gain	Error in voltage gain value
PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN	Time-out enable	Enables/disables the time-out set by the time-out delay parameter
PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN	Minimum step size	Minimum voltage step size
PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX	Maximum step size	Maximum voltage step size
PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX	Maximum VDD limit	Maximum voltage limit of the VDD
PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN	Minimum VDD limit	Minimum voltage limit of the VDD
PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT	Time-out delay	Maximum delay between a voltage change command and its acknowledge
PRCM.PRM_VPn_CONFIG[15:8] INITVDD	Initial VDD voltage	Initial voltage set in the voltage processor

Bit/Bit Field	Parameter	Description
PRCM.PRM_VPn_CONFIG[2] INITVDD	Initialize VDD	Set initial voltage given in initial VDD voltage parameter in the voltage processor
PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN	Minimum SMPS wait time	Slew rate for negative voltage steps
PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX	Maximum SMPS wait time	Slew rate for positive voltage steps
PRCM.PRM_VPn_CONFIG[1] FORCEUPDATE	Force update	Sends the value of the VP current voltage parameter as the new voltage command to SMPS

### 3.8.3.2.7 SMPS-Dependent Parameter Configuration

The values of the following parameters of the voltage processor module depend on the characteristics of the SMPS used:

- PRCM.PRM\_VPn\_CONFIG[31:24] ERROROFFSET
- PRCM.PRM\_VPn\_CONFIG[23:16] ERRORGAIN
- PRCM.PRM\_VPn\_VSTEPMIN[7:0] VSTEPMIN
- PRCM.PRM\_VPn\_VSTEPMAX[7:0] VSTEPMAX
- PRCM.PRM\_VPn\_VLIMITTO[31:24] VDDMAX
- PRCM.PRM\_VPn\_VLIMITTO[23:16] VDDMIN
- PRCM.PRM\_VPn\_VLIMITTO[15:0] TIMEOUT
- PRCM.PRM\_VPn\_VSTEPMIN[23:8] SMPSWAITTIMEMIN
- PRCM.PRM\_VPn\_VSTEPMAX[28:8] SMPSWAITTIMEMAX

For information about the values of these parameters, see the specification document of the SMPS used.

### 3.8.3.2.8 Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS

The SmartReflex module, voltage processor, voltage controller, and SMPS implement a simple handshake protocol based on a request/acknowledge mechanism (see [Figure 3-73](#)):

1. The SmartReflex module generates a VP interrupt (clears to 0) when the average error crosses the minimum or maximum error bounds.
2. The average VDDx error is passed to the voltage processor when automatic voltage control is enabled.
3. The voltage processor reads the error and generates the voltage command for the SMPS. It then informs the voltage controller that a new voltage command is ready for the SMPS. The voltage controller sends the voltage command to the SMPS (external power IC) through the dedicated I<sup>2</sup>C interface.
4. The SMPS responds to the reception of the voltage command with an acknowledgement to the voltage controller.
5. The voltage controller sends the acknowledgement to the voltage processor.
6. The voltage processor sends the interrupt-clear signal to the SmartReflex module.
7. The SmartReflex module clears the VP interrupt. It is now again ready to send a new frequency-error interrupt to the voltage processor.

Figure 3-73. SmartReflex – SMPS Communication for Automatic Voltage Adjustments

### 3.8.4 Internal LDOs Control

#### 3.8.4.1 Memory LDOs

Embedded SRAM LDOs (that is, LDO\_CORE\_M, LDO\_IVA\_M and LDO\_MPU\_M) are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage to never be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, retention and off mode:

- On mode: 1.2 V is the normal voltage reference used through all functional OPPs, whenever memories must be functional. When logic voltage level VDD\_x\_L (where x can be MPU, CORE or IVA) becomes higher than the associated memory voltage level VDD\_x\_M, the LDO operates in the tracking mode and follows its respective the VDD\_x\_L voltage level.
- Retention mode: 0.6 V is set when software allows and when all memories banks belonging to the LDO memory voltage are in Retention or Off state. In this mode, the output voltage is generated from the corresponding VDD\_x\_L logic voltage source.
- Off mode: 0 V is set when the device switches to off mode.

Section 3.8.5.1, *Memory LDOs Transitions*, presents the state transition conditions and sequences for the memory LDOs.

**NOTE:** The voltage levels associated with the different modes may depend on the device characteristics.

#### 3.8.4.2 LDO\_WAKEUP

LDO\_WAKEUP supports three voltage states depending on the PD\_WKUP and PD\_EMU activity:

- EMULATION overdrive: 1.2 V is voltage level and the LDO is set in bypass mode.
- ON: 1.06 V is the voltage reference (default state).

- SLEEP: 0.83 V is the voltage reference. It is set when the device enters sleep mode.

[Section 3.8.5.3, LDO\\_WAKEUP Transitions](#), presents the state transition conditions and sequences for the LDO\_WKUP.

---

**NOTE:** The voltage levels associated with the different modes may depend on the device characteristics.

---

At boot time, the LDO\_WAKEUP LDO is started in emulation mode. It is a software command (that is, from OS or ROM code) to set it to a different mode.

### 3.8.4.3 ABB LDOs Control

The ABB LDO supports three voltage modes:

- Bypass mode: In this mode the x\_ABB LDO is bypassed and outputs the VDD\_x\_L voltages (x refers to MPU and IVA). This mode is activated when FBB or RBB are not required, or when voltage domain enters low-power mode.
- RBB mode is enabled when the device is a strong process device at lowest OPP.
- FBB mode is enabled when the device is a weak process device at highest OPP.

The information regarding the type of device silicon process (weak, nominal, strong) is stored in eFuse. The eFuse bits values are copied to the PRCM module registers during power-on sequence.

The PRCM module provides [PRM\\_LDO\\_ABB\\_MPU\\_SETUP](#) and [PRM\\_LDO\\_ABB\\_IVA\\_SETUP](#) registers for configuration with the following controls:

- SR2EN – To enable or bypass the ABB power management
- ACTIVE\_RBB\_SEL – To enable or bypass RBB mode
- ACTIVE\_FBB\_SEL – To enable or bypass FBB mode
- SLEEP\_RBB\_SEL – To enable or bypass RBB mode when the voltage domain is lowered to sleep level
- SR2\_WTCNT\_VALUE – LDO settling delay on OPP change. The delay is in number of system clock cycles.

The PRCM module provides [PRM\\_LDO\\_ABB\\_MPU\\_CTRL](#) and [PRM\\_LDO\\_ABB\\_IVA\\_CTRL](#) register for control:

- OPP\_SEL – Current operational OPP
- OPP\_CHANGE – Initiate an OPP based ABB LDO setting change
- SR2\_STATUS – Current mode of operation of ABB LDO
- SR2\_IN\_TRANSITION – ABB LDO is in transition.

For the ABB LDO state change programming sequence, see [Section 3.10.4.2, Changing OPP](#).

### 3.8.4.4 Bandgap control

Bandgap provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the bandgap, based on the device power state. It is completely transparent to user software.

The [PRM\\_LDO\\_BANDGAP\\_CTRL\[0\] OFF\\_ENABLE](#) bit controls whether the bandgap remains on or is shut off when the device switches to OFF power state.

## 3.8.5 Voltage Domain State Transitions

In [Section 3.1.1.3.1, Voltage Domain](#), the supported states of a voltage domain were presented. This section describes the trigger conditions to enable and perform sleep and wake-up transitions on PRCM module-controlled voltage domains:

- VDD\_MPU\_L
- VDD\_IVA\_L
- VDD\_CORE\_L

- LDO\_MPU\_M
- LDO\_IVA\_M
- LDO\_CORE\_M

It also identifies state transition sequences for these voltage domains.

When the voltage domain state transition control is set to automatic, the PRCM module initiates the voltage domain state transition when the required hardware conditions are satisfied. These hardware conditions can be based on the power domain state conditions and/or system clock state conditions. The PRCM module prevents any transition when the associated conditions are not satisfied.

The LDO\_MPU\_M, LDO\_IVA\_M, or LDO\_CORE\_M memory voltage domain is automatically transitioned to the retention level whenever all memory arrays in the domain reach the RETENTION or OFF power state. Similarly, a transition back to the ON state is triggered upon one or more domain memory arrays requiring a transition back to the ON power state.

If a voltage command acknowledgement is not received within an allowed response time window (communications error over the I<sup>2</sup>C interface), an error status is logged, a global warm reset is generated, and the transition is skipped.

### 3.8.5.1 VDD\_x\_L Transitions

Transition trigger conditions for sleep transition from ON to SLEEP or RETENTION state are:

- Software setting: `PRM_VOLTCTRL[a:b] AUTO_CTRL_VDD_x_L = SLEEP (0x1) or RETENTION (0x2)`
- Power states conditions:
  - For voltage domain SLEEP state transition – all power domains in the voltage domain must be in ON-INACTIVE, RETENTION, or OFF state.
  - For voltage domain Retention state transition – all power domains in the voltage domain must be in RETENTION or OFF state.
- Clock states conditions: No clock activity on voltage domain

---

**NOTE:**

- In case of VDD\_CORE\_L sleep transition from ON to SLEEP state, the PD\_CORE can be either ON-INACTIVE or in RETENTION only.
  - In case of VDD\_MPU\_L and VDD\_IVAL sleep transition from ON to SLEEP state, the reference and bypass clocks to their respective DPLLs must also be gated.
- 

Transition trigger conditions for wake-up transition from SLEEP or RETENTION state to ON state is:

- Any wake-up event occurs on the voltage domain.

The State transition sequence:

1. All transition trigger conditions are met.
2. The voltage controller sends an On, SLEEP, or Retention command sequence over the I<sup>2</sup>C interface.
3. The PRCM module waits for I<sup>2</sup>C command sequence acknowledge.
4. The PRCM module starts the voltage transition counter.
5. When the counter expires, a voltage transition completion state is reached.

### 3.8.5.2 Memory LDOs Transitions

The transition trigger conditions for on to retention mode are:

- At least one memory bank associated with the LDO is in RETENTION state and the rest of the memory banks may either be in RETENTION or OFF states.

The transition trigger conditions for on/retention mode to off mode transition:

- Device is switching to OFF state.

Transition sequence:

1. Transition trigger conditions are true (that is, satisfied).

2. Switch LDO reference to:
  - Retention mode value if on-to-retention mode transition
  - Off mode value if on/retention-to-off mode transition
3. Start counter for LDO stabilization.
4. When counter expires voltage transition completion state is reached.

### 3.8.5.3 LDO\_WAKEUP Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and PD\_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD\_WKUP (and system clock is gated at SCRM level)

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: PD\_EMU is Off and device is in active mode OR
- Clock states: PD\_EMU is Off and any clock other than 32K clock is active in PD\_WKUP

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and PD\_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD\_WKUP (and system clock is gated at SCRM level)

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD\_EMU

Transition sequence:

1. Transition trigger conditions are met.
2. LDO\_WAKEUP initiates the transition.
3. Starts a counter for LDO\_WAKEUP transition.
4. LDO\_WAKEUP transition completes.

### 3.8.6 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD\_MPU\_L, VDD\_IVA-L, and VDD\_CORE\_L), independently of each other. Upon current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase of performance, voltage is first raised, and then frequency is increased. For a decrease of performance, frequency is first decreased, and then voltage is dropped.

#### 3.8.6.1 EMIF Clocks Frequency Scaling Constraints

CD\_EMIF is inside the PD\_CORE. The EMIF subsystem is getting several clocks:

- L3 interface clock
- DLL\_CLK clock (that is, DLL clock): For the DLL only
- PHY\_ROOT\_CLK clock (that is, DDR PHY clock): For external memory access and source of functional clock to EMIF

L3 interface clock frequency can be changed on the fly without affecting EMIF operations as long as DLL\_CLK and PHY\_ROOT\_CLK clocks are not affected. EMIF has internal asynchronous bridge to handle different interface and functional clocks.

When DDR PHY clock frequency is to be changed, EMIF must be put into IDLE state. This ensures that external memory is in self-refresh mode.

Similarly, DLL frequency change implies that DLL must relock. It can be done only when EMIF is in IDLE state. Relock time is 400 DLL clock cycles.

The EMIF clocking scheme allows for change of OPP without DLL relock (that is, DLL is clocked by a relatively low frequency supported in all OPPs). Then change of OPP consists only in changing the DDR PHY clock frequency (and eventually L3 interface clock frequency).

---

**NOTE:** Software must ensure that no master module tries to access the registers of the EMIF during this sequence.

---

EMIF clocks control requirements in the PRCM module:

- EMIF clock frequency setting should be done through shadow registers for DLL\_CLK and DDR\_PHY clocks.
- EMIF clock frequency update bit field should be used to copy shadow register value as current values.
- The PRCM module hardware manages automatic EMIF clock frequency update sequence:
  - Put the EMIF into IDLE state.
  - Upload shadow register values in corresponding current register and wait for new EMIF clocks to be stable.
  - Put the EMIF module back into ACTIVE state

---

**NOTE:** The PRCM module should not gate the DLL\_CLK and DDR\_PHY clocks during automatic EMIF frequency change.

---

Programming model to perform automatic EMIF frequency change as part or not of an OPP change (DVFS). The automatic EMIF frequency change must always be performed while CD\_EMIF is under software-forced wakeup (SW\_WKUP).

#### ***VDD\_CORE\_L voltage fixed and only clock frequency switching***

Changing EMIF clock frequency without voltage change (example, change of SYS\_CLK divider value while DPLL\_CORE is in bypass, change of DPLL\_CORE mode between bypass and lock)

- Software writes new EMIF timing parameters in shadow registers of the EMIF.
- It then configures the clock selection and frequency setting shadow registers in the PRCM module.
- The PRCM module sends an idle request to the EMIF (overriding the software settings of the MODULEMODE bit field for EMIF).
- EMIF stalls transactions on internal interconnect, completes all committed transaction to the external memory and then puts the external memory in self-refresh mode
- EMIF module then acknowledges the idle request of the PRCM module.
- The PRCM module uploads the values configured in the shadow register bit fields to the corresponding current register bit fields.
- The PRCM module waits for stabilization of the PHY\_ROOT\_CLK and DLL\_CLK clocks through hardware monitoring, according to new settings.
- The PRCM module requests the EMIF to exit idle (stops the overriding of the software settings of the MODULEMODE bit field for EMIF).
- The PRCM module clears the frequency update field.
- The EMIF copies the timing parameter configured in the shadow register as the current values.
- The EMIF acknowledges that the PRCM module is functional, and starts accepting the transactions on the internal interconnect.
- If DLL clock was changed, EMIF waits for DLL to be relocked and transactions on internal interconnect, if required. The PRCM module is not aware of the DLL operations.
- Accesses to SDRAM are serviced again:

Software execution can be stalled during the frequency change without harm as the critical hardware sequence is performed without software intervention. After having set the frequency update field, software should only poll for its clearing.

Accesses to external SDRAM are stalled during following duration:

- 2  $\mu$ s maximum due to EMIF entering and exiting idle
- + 400 DLL clock cycles in case DLL clock frequency has changed.
- + DPLL lock time in case DPLL has been locked.

#### **VDD\_CORE\_L voltage change for OPP switching**

It is assumed that DLL clock frequency is not changed and that the DPLL\_CORE mode is not changed and stays locked. Only the DDR\_PHY clock frequency is changed using the post divider. L3 clock is likely also changed, but it does not impact EMIF.

Accesses to external SDRAM should be stalled at maximum during 2  $\mu$ s due to this sequence.

Voltage scaling up consists of:

Software indicates to EMIF that voltage change operation has started to allow EMIF to ensure regular code updates from DLL masters.

Software disables SmartReflex for core voltage

Software performs direct VDD\_CORE setting to new noncorrected value (for weak silicon) and wait for voltage stabilization.

Software configures SmartReflex for corresponding OPP .

Software re-enable SmartReflex for core voltage.

Software indicates to EMIF that voltage change operation is complete and it need not control the code update from DLL masters directly.

#### **3.8.6.2 GPMC Clocks Frequency Scaling Constraints**

CD\_L3\_2 is inside the PD\_CORE. It supplies the L3\_ICLK2 clock to the general-purpose memory controller (GPMC) module, which is used as interface and functional clock. GPMC timing parameters are supposed be programmed at boot for the nominal OPP. Theses timing parameters can be used for lower L3 frequency, at the downside of having slower access to external memory.

External memory connected to GPMC may not support on-the-fly L3 frequency changes. Following is the sequence to perform L3 frequency change as part or not of an OPP change (DVFS).

##### **Hardware-controlled sequence**

1. Software writes new L3 clock settings in the shadow register and sets the frequency update field.
2. The PRCM module requests idle to GPMC.
3. GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. GPMC acknowledges idle. Any access to GPMC is then stalled.
5. The PRCM module uploads the values of the shadow-register bit field in corresponding current bit field.
6. The PRCM module waits for stabilization of the L3 clocks by monitoring the DPLL\_CORE lock and/or divider acknowledge signals according to new settings.
7. The PRCM module clears the frequency update field.
8. The PRCM module requests the GPMC to exit idle.
9. GPMC re-allows interconnect connection and acknowledges it is functional.
10. Accesses to external memory are serviced again.

##### **NOTE:**

- The frequency update field is the same as the one for EMIF clock change. The same hardware in the PRCM module handles the frequency change of L3, DDR\_PHY, and DLL clocks.
- If the GPMC supports on-the-fly L3 frequency change, then the [CM\\_SHADOW\\_FREQ\\_CONFIG2\[0\]](#) GPMC\_FREQ\_UPDATE bit can allow bypassing of the sequence.

##### **Software-controlled sequence**

1. Software configures the PRCM module to disable GPMC.

2. The PRCM module requests idle to GPMC.
3. GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. GPMC acknowledges idle. Any access to GPMC is then stalled.
5. Software programs the PRCM module to change L3 frequency and wait for L3 stabilization.
6. Software configures the PRCM module to re-enable GPMC.
7. GPMC re-allows interconnect connection and acknowledges it is functional.
8. Accesses to external memory are serviced again.

### 3.8.6.3 CORE DVFS Versus Subsystem Functionality

#### 3.8.6.3.1 Display Subsystem

The display subsystem is part of the CORE voltage domain. It has internal FIFOs that are sized to sustain a change of OPP on the CORE voltage domain with no DPLL relock and no DLL frequency change. Accesses to external SDRAM are stalled at maximum during 2  $\mu$ s in these conditions. DSS functional clock is not affected by the change of OPP on CORE voltage domain. Hence, DSS supports on the fly DVFS of the CORE voltage domain, assuming selected OPP remains compatible with the current DSS processing.

#### 3.8.6.3.2 IVAHD

IVAHD is part of the IVA voltage domain. It can sustain a temporary stall of external SDRAM accesses because it is not real-time processing. IVAHD functional clock is not affected by the change of OPP on the CORE voltage domain; therefore, IVAHD supports on-the-fly DVFS of the CORE voltage domain.

#### 3.8.6.3.3 Imaging Subsystem

The Imaging subsystem (ISS) is part of the CORE voltage domain. It is real-time processing (or data flow). It cannot support a 2- $\mu$ s stall of external SDRAM access, due to the heavy data throughput (FIFO size increase is prohibitive). As a consequence, ISS does not support on-the-fly change of OPP on CORE voltage domain. However, the CORE DVFS can be synchronized to the interframe idle window of ISS. During this window, ISS does not initiate transaction to external SDRAM. Core OPP can be changed safely assuming selected OPP remains compatible with the current ISS processing. ISS functional clock frequency can either remain unchanged, or be scaled according to the OPP change, assuming it remains compatible with the current ISS processing. This is the responsibility of software.

Example: CORE OPP change OPP50% $\rightarrow$ OPP100%, with functional clock frequency unchanged – OPP is 50%, ISS functional clock is at 50 MHz, clock coming from CORE DPLL, ISS clock divider is set to 4

Software performs OPP change: OPP50% $\rightarrow$ OPP100%, – ISS is now at 100 MHz – SW sets the ISS clock divider to 8. - ISS functional clock is back at 50 MHz

### 3.8.6.4 DVFS Voting Mechanism (VDD\_CORE\_L and VDD\_IVA\_L Voltage Domains)

#### 3.8.6.4.1 CORE OPP Voting Architecture

Core voltage domain operating point can be determined based on the following system masters:

- APE DSP processor
- APE Cortex-M3 MPU processor
- Modem

The PRCM module provides:

- Four read/write voting registers (that is, CM\_CORE\_DVFS\_PERFn, where n = 1 to 4). Software can use these, to specify the performance level of the CORE voltage domain as requested by each system master (likely EMIF bandwidth only). Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register (that is, CM\_CORE\_DVFS\_CURRENT) to identify the current CORE voltage domain OPP setting. Software must configure this register based on current OPP setting of the register. It is not managed by hardware.

See [Section 3.8.6.4.3, Voting Mechanism](#), to understand the voting mechanism for DVFS on the voltage domain.

### 3.8.6.4.2 IVA OPP Voting Architecture

IVA voltage domain operating point can be determined based on the following subsystems performing different type of processing:

- DSP processor
- IVAHD accelerator
- ABE

The PRCM module provides:

- A read/write voting register (that is, `CM_IVA_DVFS_PERF_<Subsystem name>`) for each subsystem. Software can use these, to specify the performance level of the IVA voltage domain as requested by each subsystem. Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register, that is, `CM_IVA_DVFS_CURRENT`, to identify the current IVA voltage domain OPP setting. It is again the software's responsibility to configure this register based on current OPP setting of the register. It is not managed by hardware.

See [Section 3.8.6.4.3, Voting Mechanism](#), to understand the voting mechanism for DVFS on the voltage domain.

### 3.8.6.4.3 Voting Mechanism

The operating point change for the CORE and IVA voltage domains can be performed by the respective masters or subsystems by executing the following steps:

1. Obtain ownership of the voltage domain DVFS semaphore using the SPINLOCK module.
2. Write new performance requirement value in its voting register.
3. Read the current OPP and the voting registers.
4. Compute the result of the voting using ad hoc algorithm (for example, sum of performance requirements).
5. If the current OPP does not match the voting result (that is, either the OPP must be decreased in case of low performance demand, or the OPP must be increased in case of high performance demand) then the system master performs voltage domain OPP change to best match the voting result.
6. When change of OPP is completed, update the current voltage domain OPP register accordingly.
7. Release the voltage domain DVFS semaphore, using the SPINLOCK module.

## 3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in the ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

Typically, the PRCM module can lower or even turn off the SMPS, shut down the system clock supplier, and allow the external power IC to turn off its internal resources.

These device low-power states are characterized by the system power consumption, the wake-up latency, and the required functionality.

The low-power states are:

- RETENTION: All the logic voltage domain (`VDD_IVA_L` and `VDD_CORE_L`) are in Retention state
- OFF: All the logic voltage domains are in Off state
- LOW POWER: Any combination of logic voltage domains states (ON, SLEEP, and RETENTION state), other than those identified above.

Once the PRCM module hardware detects any valid combination of power domain state and if a proper programming model of the PRCM module has been set, the PRCM module automatically triggers the transition into the device low-power mode.

### 3.9.1 Device Wake-Up Source Summary

Each power domain in the device may contain modules that can generate the wake-up events. However, when the device is in OFF power state and all the logic voltage domains are off, only the modules with wake-up capability and that are in the PD\_WKUP power domain can generate the wake-up event. Modules in the other power domains require that their voltage domain be in RETENTION, SLEEP, or ON state to generate a wake-up event. Some modules may have a further constraint that their power domain should be ON-INACTIVE or in CSWR RETENTION state to generate the wake-up event.

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require any active clock.

The Modules Attributes subsection of each clock domain in [Section 3.6, Clock Management Functional Description](#), presents the wake-up capability support for each module of the corresponding power domain.

### 3.9.2 Device RETENTION State Management

In Retention state, the voltages to the device are lowered to their minimum value to retain only the logic build with RFFs, while all DFF logic is lost. The memory area may be retained, depending on software configuration.

The device integrates enhanced device wake-up management while in Retention state. This allows:

- Triggering wake-up with limited capabilities from almost all programmed input pads all around the device.
- Triggering wake-up with full capabilities by using few GPIO inputs in the PD\_WKUP power domain.

The logic voltages VDD\_CORE\_L, VDD\_MPU\_L, and VDD\_IVA\_L can transition to their retention value independently. Once the voltage domain state transition conditions are met in compliance with the software configuration, the PRCM module hardware initiates the transition into Retention state by sending an I<sup>2</sup>C command for the corresponding SMPS.

When all the logic voltages are transitioned to their Retention state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD\_CORE\_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD\_CORE\_L SMPS upon toggle of the power request.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD\_CORE\_L SMPS).
- The PRCM module sends Retention and On commands through the I<sup>2</sup>C interface. Indeed, the retention voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down must be set to a zero value.

### 3.9.3 Device OFF State Management

The off mode is the device mode where all power domains except for PD\_WKUP are in OFF state and the logic voltage domains (VDD\_MPU\_L, VDD\_IVA\_L and VDD\_CORE\_L) are shut down by the external power IC. Other power sources, such as the DPLL supplies, can be shut down by the external power IC during the off mode period.

The device integrates enhanced device wake-up management while in Retention state. This allows:

- Saving I/Os leakage by settings pads in the lowest power state compatible with the device environment.
- Triggering wake-up with limited capabilities from almost all programmed input pads all around the device.
- Triggering wake-up with full capabilities by using few GPIO inputs in the PD\_WKUP power domain.

This section details the way the PRM manages and sequences the control of the various off mode contributors:

- LDO\_WAKEUP
- Memory LDOs
- ABB LDOs
- Voltage controller
- Hardware save-and-restore mechanism
- Hardware power request signal

---

**NOTE:** For more information about the save-and-restore mechanism, see [Section 16.4.21](#), *Auto-Restore Feature*, in [Chapter 16](#).

---

Once the hardware conditions is met and according to the software configuration the PRCM module hardware initiates the transition into off mode by sending I<sup>2</sup>C commands for each SMPS and by respecting required sequencing between the voltage domains.

When all the logic voltages are transitioned to their Retention state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

The PRCM module, SCRM and the external power IC can also be programmed so that the voltage VDD\_CORE\_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD\_CORE\_L SMPS upon toggle of the power request.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD\_CORE\_L SMPS).
- The PRCM module sends Off and On commands through the I<sup>2</sup>C interface. Indeed, the Off voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down shall be set to a zero value.

### 3.9.3.1 Device Off Mode Sleep Sequence

This section describes the main steps of the device off mode sleep sequence. The Off command to shut down the voltages VDD\_MPU\_L, VDD\_IVA\_L, and VDD\_CORE\_L can be sent through the I<sup>2</sup>C interface. The VDD\_CORE\_L may also be controlled independently using the power request signal.

---

**NOTE:** The power request signal can be used to turn off other resources of the power-management IC, even when it is not used for the VDD\_CORE\_L management.

---

---

**NOTE:** LDOs in the power companion device (TWL60xx), which are turned off in ACTIVE state, are switched on when entering into SLEEP state with the default value.

After the first power on, all resources must be configured, especially the power resources that are not part of the power-up sequence. This must be done by sending a command through the I<sup>2</sup>C interface.

---

1. Software has completed preliminary settings such as:
  - Settings in the external power IC
  - Voltage transition settling time settings in PRCM
  - Context save for the relevant modules
  - System control module is configured with valid I/O pads off mode configuration.
  - Enable/disable the wake-up feature for each pad by programming the system control module.
  - Enable/disable the automatic gating of the system clock (PRCM).
  - Enable the I/O wake-up scheme (PRCM).
  - Program a consistent power state for each power domain (that is, Off state for domains without

hardware restored modules and OSWR state for domains with hardware restored modules build with RFF logic).

- All modules in the PD\_WKUP power domain must have their interrupts to Cortex-M3 and DSP, and their DMA requests to sDMA disabled.
- Program automatic transition of the CD\_WKUP clock domain.
- Enable the off mode scheme (PRCM).
- Configure the VDD\_CORE\_L management option:
  - Disable the option if power request signal is not used for VDD\_CORE\_L management.
  - Enable the option if power request signal is used for VDD\_CORE\_L management.

2. The PRCM module initiates the transition into off mode upon all following conditions:

- All the programmable power domains have reached their targeted Low-Power state which can either be Off or OSWRET. It does not apply to always-on power domains and to the EMU power domain.
- The CD\_WKUP clock domain is idled.
- The off mode has been enabled by software.

At this stage the I/O wake-up scheme through the I/O pad daisy-chain is already enabled. The I/O isolation scheme is managed in parallel with the following sequence (see [Section 3.9.4, I/O Management](#)).

3. The PRCM module triggers in parallel:

- Switch off all SRAM LDOs.
- Bypass all ABB LDOs.
- Isolate the analog area from digital supply removal.

4. The PRCM module then sends in a row the Off command for the voltages VDD\_IVA\_L and the VDD\_MPU\_L, once the following conditions are met:

- I/O isolation scheme is complete.
- SRAM LDOs have ramped down to 0 V.
- ABB LDOs have switched in bypass.

The order between the two Off commands is irrelevant and managed by the voltage controller.

5. Once the voltages VDD\_IVA\_L and VDD\_MPU\_L are ramped down to 0 V the PRCM module sends the Off command for the voltage VDD\_CORE\_L:

- If power request signal is not used for VDD\_CORE\_L management then the VDD\_CORE\_L is ramped down to 0 V.
- If power request signal is used for VDD\_CORE\_L management then the Off command for the voltage VDD\_CORE\_L, through the I<sup>2</sup>C interface, has no effect and the voltage VDD\_CORE\_L remains unchanged.

6. Once the Off command for VDD\_CORE\_L is sent and acknowledged, the PRCM module gates locally its system clock.

7. The PRCM module then deassert the signal system clock request to the SCRM, if so configured by the software. Similarly, it deasserts the signal power request if configured by software.

- If power request signal is used for VDD\_CORE\_L management, then VDD\_CORE\_L is ramped down to 0 V.

8. The SCRM then acknowledges the power request to the PRCM module. This acknowledge is required by the PRCM module before toggling again the signal power request.

9. The SCRM informs the PRCM module that all versions of the system clock have been gated; hence the PRCM module can transition the LDO\_WAKEUP to SLEEP state if the PD\_EMU power domain is in OFF state.

10. The DEVICE\_OFFWKUP\_CORERSTACTST signal intended for the core control module is asserted. The EMIF1\_DEVICE\_OFFWKUP\_CORERSTACTST and EMIF2\_DEVICE\_OFFWKUP\_CORERSTACTST signals intended for EMIF1 and EMIF2, respectively, are asserted according to their associated register bit fields, EMIF1\_OFFWKUP\_DISABLE and EMIF1\_OFFWKUP\_DISABLE.

### 3.9.3.2 Device Off Mode Wake-Up Sequences

The wake-up sequence includes a phase of hardware restore. Depending on the wake-up event source the restore sequence completes in one or two phases. The first phase always happens and is sufficient to serve some type of wake-up events; for other sources of event a second phase is required and occurs immediately after the first phase. Phase 2 is also split into two subphases (phase 2a and phase 2b). The device returns to off mode after the first phase completes.

Table 3-295 lists the device off wake-up and hardware restore phases.

**Table 3-295. Device Off Wake-Up and Hardware Restore Phases**

Wake-Up Event	Phase 1	Phase 2	Comment
Wake-up request from PD_WKUP	Yes	Yes	This event must wake up the PD_MPU power domain by dependency.
PRM interrupt toward MPU-A9 (includes I/O wake-up detection)	Yes	Yes	This event wakes up the PD_WKUP power domain. The PD_MPU power domain is woken up by broadcast of the wake-up event and the MPU-A9 boots up.
Global warm reset	Yes	No	After voltage stabilization, phase 1 restoration is performed. Then MPU-A9 reboots, because global warm reset is a source of PD_MPU power domain wakeup.

#### 3.9.3.2.1 Wake Up From a Wake-Up Event

This section describes the main steps of the wake-up sequence to exit the device from off mode. The On command to ramp-up the voltages VDD\_MPU\_L, VDD\_IVA\_L, and VDD\_CORE\_L can be sent through the I<sup>2</sup>C interface. VDD\_CORE\_L can also be controlled independently using the power request signal.

---

**NOTE:** The power request signal can be used to turn on other resources of the power-management IC, even when it is not used for the VDD\_CORE\_L management.

---

Additionally it is assumed in this sequence that the wake-up source is not a global warm reset.

1. The PRCM module switches the LDO\_WAKEUP from SLEEP to ON state and waits for the setup time of the LDO\_WAKEUP (that is, four clock cycles of the 32-kHz clock).
2. The PRCM module asserts the system clock request signal to SCRM, which in turn sends the request to the external power IC. The SCRM accounts for the system clock stabilization time before enabling the clock to the PRCM module.
3. The PRCM module also asserts the power request signal to the SCRM. The PRCM module waits for the acknowledge of its power request signal and activation of the system clock before sending an I<sup>2</sup>C command for the voltage ramp-up sequence.
  - If power request signal is used for VDD\_CORE\_L management, then the power-management IC ramps up the voltage VDD\_CORE\_L.
  - If power request signal is not used for VDD\_CORE\_L management, then the voltage VDD\_CORE\_L is unchanged.
4. The PRCM module sends the On command for the VDD\_CORE\_L voltage ramp up, through the I<sup>2</sup>C interface and waits for the setup time of the SMPS.
  - If power request signal is used for VDD\_CORE\_L management, then the voltage VDD\_CORE\_L is unchanged.
  - If power request signal is not used for VDD\_CORE\_L management, then the power-management IC ramps up the voltage VDD\_CORE\_L.
5. The PRCM module sends in a row the On commands for the voltages VDD\_MPU\_L and VDD\_IVA\_L and waits for the setup time of the two SMPS.
6. The PRCM module enables the system clock to the eFuse controller and releases its reset line. It holds the other asserted resets until completion of the EFUSE bits sensing.
7. The PRCM module waits for the stabilization of the bandgap, memory LDOs and ABB LDOs stabilization.
8. Hardware restore phase 1 starts:
  - (a) The PRCM module ensures that:

- CORTEXA9, CORTEXM3, and DSP are held in reset.
  - C2C is kept in STANDBY state.
  - sDMA receives the restore request.
  - Phase 1 descriptor start address is sent to the sDMA.
  - MODULEMODE bit field of the L3\_3 module is overridden to auto mode. This ensures the successful restoration of its firewalls during phase 1 of the restore.
- (b) The PRCM module generates a wake-up event on the CD\_SDMA clock domain. As a result, the PD\_CORE power domain and CD\_SDMA wake-up. This causes the CD\_L3\_1, CD\_L3\_2, CD\_L4\_CFG, CD\_MEMIF, CD\_L4\_PER, and CD\_L3\_INIT to wake up because of the wake-up broadcast due to static dependency and their respective reset are released once their clock is active. The clock domain L4\_WKUP is woken up (due to a wake-up broadcast on static dependency).
- (c) The sDMA switches from STANDBY to ACTIVE state and performs phase 1 of the hardware restore:
- Firewalls
  - System control module
  - EMIF
  - Part of the CM1 and part of the CM2 (core clock configuration, registers CLKTRCTRL of the CD\_MPU, CD\_L3\_1, CD\_L3\_2, CD\_L4\_CFG, CD\_MEMIF, CD\_L4\_PER, and CD\_L3\_INIT clock domains)
- The sDMA make the last write into the PRCM module end of phase 1 bit field. The PRCM module then switches it to STANDBY state and resets it.
- (d) The PRCM module releases I/O isolation of the EMIF. The other I/Os stay isolated.
- (e) The PRCM module checks and waits if necessary for the DPLL\_CORE to be in a stable state.
- (f) In parallel the PRCM module does the following:
- Release the condition preventing C2C to remain in STANDBY state
  - Release the override of the MODULEMODE bit field of the L3\_3 module
9. Upon a need to perform phase 2 of the hardware automatic restore (according to the wake-up source), the following sequence occurs:
- (a) Phase 2a sequence.
- (i) The PRCM module drives the phase 2a descriptor start address to the sDMA.
  - (ii) The PRCM module releases the sDMA from reset.
  - (iii) The PRCM module generates a wake-up event on the CD\_SDMA clock domain (same as in Step 2 of phase 1).
  - (iv) The sDMA performs phase 2a of the hardware restore:
    - The MODULEMODE bit field of each module to be restored during phase 2b is set to Enabled or Auto and the SARMODE bit field is enable if applicable. Only modules that have just interface clock(s) can be restored automatically.
    - Register [CM\\_SDMA\\_STATICDEP](#) is set to enable all necessary static dependency To wake up all power domains having modules to be restored during phase 2b

The sDMA makes the last write into the PRCM module at the end of phase 2a bit field. The PRCM module then switches it to Standby state and resets it. This completes phase 2a.
- (b) Phase 2b sequence.
- (i) The PRCM module drives the phase 2b descriptor start address to the sDMA.
  - (ii) The PRCM module releases the sDMA from reset.
  - (iii) The PRCM module generates a wake-up event on the CD\_SDMA clock domain (same as in Step 2 of phase 1).
  - (iv) The sDMA performs phase 2b of the hardware restore:
    - Restore of the relevant modules

The sDMA make the last write into the PRCM module at the end of phase 2b bit field. The PRCM module then switches it to STANDBY state and resets it. This completes phase 2b.
10. The PRCM module releases I/O isolation of the remaining I/O, only if the [PRM\\_IO\\_PMCTRL.ISOOVR\\_EXTEND](#) bit field is not set.
11. The PRCM module releases the reset stall conditions holding CORTEXA9, CORTEXM3, and DSP in reset.
12. The PD\_MPU power domain is woken up if required according to the wake-up source.

### 3.9.3.2.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence referred in [Section 3.9.3.2.1, Wake up From a Wake-Up Event](#), is modified as follows:

Steps 4 and 5 are replaced by:

- The PRCM module waits for the three voltages VDD\_MPU\_L, VDD\_IVA\_L, and VDD\_CORE\_L stabilization time. It uses the [PRM\\_VOLTSETUP\\_WARMRESET](#) register for that purpose.

Step 6 is replaced by:

- The PRCM module enables the system clock to the eFuse controller and releases its reset line. In parallel, the device reset manager counts for global reset extension (setup by the [PRM\\_RSTTIME\[9:0\] RSTTIME1](#) bit field). The PRCM module holds the other asserted resets until completion of the eFuse bits sensing and the global reset counter overflow.

Phase 2 of the hardware restore sequence is skipped.

The hardware blocks and modifies the [FREQ\\_UPDATE](#) bit field of [CM\\_SHADOW\\_FREQ\\_CONFIG1](#) register during phase 1.

### 3.9.3.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in [Section 3.9.3.2.2, Wake up Upon Global Warm Reset](#), is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during eFuse sensing or during phase 1 of automatic restore):

- Global warm reset is delayed and applied after of phase 1 restore completes.
- Phase 2 of restore is discarded.
- MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

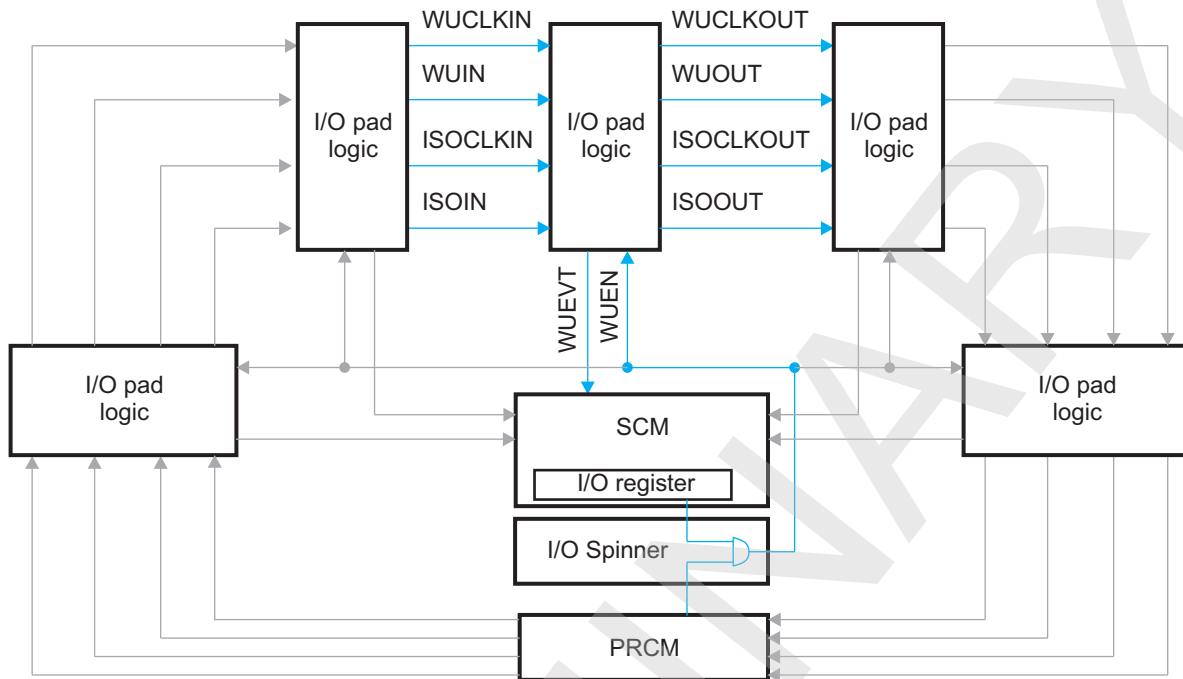

- Global warm reset is applied immediately.
- Phase 2 of restore is discarded.
- MPU boots after the warm reset sequence completes.

### 3.9.4 I/O Management

[Figure 3-74](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-74. I/O Pads Daisy-Chain Configuration

prcm-076

Any I/O pad of the device can be configured to generate a wake-up event when the device is in off mode. This is managed by the configurations in the system control module and the PRCM.

In the off mode, the I/O pads of the device form a daisy chain with the I/O pad logic output of one pad connected to the I/O pad logic input of the next one. The I/O pad logic at the two ends of the chain is connected to the PRCM.

The I/O pad wake-up scheme must be enabled (WUEN signal) globally by setting the [PRM\\_IO\\_PMCTRL\[16\]](#) GLOBAL\_WUEN bit and by also setting I/O pad wake-up enabled/disabled individually (WUEN signal) by writing to the following bit fields in the control module:

- CONTROL.CONTROL\_PADCONF\_<IOpad>[14] WAKEUPENABLE0
- CONTROL.CONTROL\_PADCONF\_<IOpad>[30] WAKEUPENABLE1

Once configured, the wake-up scheme within each I/O pad is enabled and disabled by triggering a control (WUCLKIN signal) of the I/O daisy chain. This is done thanks to a dedicated PRCM module register bit [PRM\\_IO\\_PMCTRL\[8\]](#) WUCLK\_CTRL. The software must enable the I/O wakeup prior entering a low-power mode and disable it following a wake-up event.

Writing the [PRM\\_IO\\_PMCTRL\[8\]](#) WUCLK\_CTRL bit to 1 asserts signal WUCLKIN high to reset spurious wake-up event and to latch the current pad input value. PRCM module register [PRM\\_IO\\_PMCTRL\[9\]](#) WUCLK\_STATUS logs the signal WUCLKOUT of the last pad of the I/O ring. Once this status is set to 1, the software may clear the [PRM\\_IO\\_PMCTRL\[8\]](#) WUCLK\_CTRL bit to effectively enable or disable the wake-up feature within each pad.

Additionally, it is required that the WUCLKIN is forced to 1 during global power-on reset. The I/O wake-up feature is enabled or disabled depending on a control (WUEN) for each I/O pad. This control is generated by the Spinner logic resulting of the combination of a local enable/disable bit per pad located in the control module and a global enable/disable bit located in the PRCM module, that is, [PRM\\_IO\\_PMCTRL\[16\]](#) GLOBAL\_WUEN.

When a wake-up event is detected by a wake-up enabled I/O pad in the daisy chain, it is logged within the I/O and is conveyed to the system control module (WUEVT signal). All the I/O wake-up event statuses are mapped on memory-mapped registers in the system control module.

When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the corresponding

- CONTROL.CONTROL\_PADCONF\_<IOpad>[15] WAKEUPEVENT0
  - CONTROL.CONTROL\_PADCONF\_<IOpad>[31] WAKEUPEVENT1
- bit fields in the Control Module.

For information about the Control Module, see [Chapter 18, Control Module](#).

I/Os have two associated buffers, that is, 1.2 V and 1.8 V. A software configuration determines which one is used in normal operation. However, in the device off mode, the 1.2-V buffer is always disabled, and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage, if pad configure to drive the output.

### 3.9.4.1 Hardware-Controlled I/O Isolation Sequences

I/Os have 2 buffers: 1.2 V and 1.8 V.

The software configuration determines whether the 1.2-V buffer or the 1.8-V buffer is used. Regardless of the buffer used, in off mode the 1.2-V buffer is always disabled and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage (if the pad is configure to drive the output).

In addition to this, I/Os support the following features:

**wake-up override:** The PRCM module can control the I/Os that are woken-up, that is, brought out of isolation from device off mode based on the source of wakeup. The primary application of this feature is to only restore minimal context of the device for access to EMIF upon C2C request.

**Wakeup Phased Wakeup:** The I/Os support a phased wake-up approach, meaning, the I/Os can be brought out of off mode isolation in two phases without affecting the functional operation of the I/Os already out of isolation. This feature is used to wake up the I/Os still held in isolation without affecting the EMIF operations when a full device wake-up is requested.

The I/O transitions are:

- Full on to full isolation - Pad output controls are stable (A, GZ). Pad off mode configuration is activated.
- Full Isolation to EMIF on - EMIF I/O interface is brought out of isolation. Partial device context is restored.
- EMIF on to Full on - EMIF I/O interface are already out of isolation and a new wake-up event requires a full device wakeup.
- EMIF on to Full Isolation - EMIF I/O interface and some nonrestore sensitive I/Os are already out of isolation. The PRCM module puts the device back in off mode.

### 3.9.4.2 Software-Controlled I/O Isolation

In addition to the hardware-controlled I/O transitions, there is a dedicated PRCM module register bit, [PRM\\_IO\\_PMCTRL\[0\] ISOCLK\\_OVERRIDE](#), that can be use by the software to force ISOCLKIN signal to the I/O pad. It is then propagated from one pad to the other in the wake-up enabled dasy chain of I/Os. The PRCM module register [PRM\\_IO\\_PMCTR\[1\] ISOCLK\\_STATUS](#) logs the signal ISOCLKOUT of the last pad of the I/O dasy chain.

---

**NOTE:** Override should be used at boot time only when software needs to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled by hardware only.

---

[PRM\\_IO\\_PMCTRL\[4\] ISOOVR\\_EXTEND](#) bit allows extending the nonEMIF I/O isolation. This feature can be used by software to restore modules driving output such as GPIO while nonEMIF I/Os are still isolated. Once software has completed relevant module restore, it clears the bit and hardware performs the Full Isolation to EMIF on hardware-controlled I/O transition.

The [PRM\\_IO\\_PMCTRL\[5\] IO\\_ON\\_STATUS](#) status bit is available for software to check completion of the EMIF on transition.

### 3.10 PRCM Module Programming Guide

#### 3.10.1 DPLLs Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the module.

##### 3.10.1.1 Global Initialization

###### 3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

Table 3-296 shows the global initialization of the surrounding modules.

**Table 3-296. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

###### 3.10.1.1.2 DPLL Global Initialization

###### 3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a power-on or software reset and then locks it to the desired synthesized clock frequency.

**Table 3-297. DPLL Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure SSC parameters	See Section 3.10.1.1.2.2.	
Configure Recalibration parameters	See Section 3.10.1.1.2.3.	
Set DPLL automatic idle mode	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx <sup>(1)</sup>
Configure synthesized clock parameters	See Section 3.10.1.1.2.4.	
Configure output clocks parameters	See Section 3.10.1.1.2.5.	
Lock DPLL	CM_CLKMODE_<DPLL name>[0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See Section 3.6.3.3.3, DPLL Power Modes.

###### 3.10.1.1.2.2 Subsequence – SSC Parameter Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

**Table 3-298. DPLL SSC Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure M Step Size	CM_SSC_DELTAMSTEP_<DPLL name>[19:0] DELTAMSTEP	xx <sup>(1)</sup>
Configure modulation frequency divider exponent part	CM_SSC_MODFREQDIV_<DPLL name>[10:8] MODFREQDIV_EXPONENT	xx <sup>(1)</sup>
Configure modulation frequency divider mantissa part	CM_SSC_MODFREQDIV_<DPLL name>[6:0] MODFREQDIV_MANTISSA	xx <sup>(1)</sup>
Enable/disable frequency downspread	CM_CLKMODE_<DPLL name>[14] DPLL_SSC_DOWNSPREAD	xx <sup>(2)</sup>
Enable SSC feature	CM_CLKMODE_<DPLL name>[12] DPLL_SSC_EN	0x1

**Table 3-298. DPLL SSC Parameter Configuration (continued)**

Step	Register/Bit Field/Programming Model	Value
Wait until SSC start acknowledge	CM_CLKMODE_<DPLL name>[13] DPLL_SSC_ACK	0x1

(1) See SSC description in [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#).

(2) The selected value depends on the desired SSC feature settings.

### 3.10.1.1.2.3 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

**Table 3-299. DPLL Recalibration Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status	PRM_IRQSTATUS_<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag	PRM_IRQENABLE_<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

### 3.10.1.1.2.4 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

**Table 3-300. DPLL Synthesized Clock Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Set DPLL clock synthesis multiplier	CM_CLKSEL_<DPLL name>[2:0] DPLL_MULT	xx <sup>(1)</sup>
Set DPLL clock synthesis divider	CM_CLKSEL_<DPLL name>[2:0] DPLL_DIV	xx <sup>(1)</sup>
<b>IF</b> : Low-power mode operation conditions satisfied?	Software test condition. See <a href="#">Section 3.6.3.3.2</a> .	
Enable DPLL low-power operation mode	CM_CLKMODE_<DPLL name>[10] DPLL_LPMODE_EN	0x1
<b>ENDIF</b>		

(1) It depends on the desired synthesized clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).

### 3.10.1.1.2.5 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

**Table 3-301. DPLL Output Clock Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Set output clock dividers (that is, M2, M3 and Mn), where n is from 4 to 7. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[4:0] DPLL_CLKOUT_DIV CM_DIV_M3_<DPLL name>[4:0] DPLL_CLKOUTHIF_DIV CM_DIV_Mn_<DPLL name>[4:0] HSDIVIDER_CLKOUTn-3_DIV	xx <sup>(1)</sup>
Wait until divider change acknowledged	CM_DIV_M2_<DPLL name>[5] DPLL_CLKOUT_DIVCHACK CM_DIV_M3_<DPLL name>[5] DPLL_CLKOUTHIF_DIVCHACK CM_DIV_Mn_<DPLL name>[5] HSDIVIDER_CLKOUTn-3_DIVCHACK	Bit toggled <sup>(2)</sup>
Enable/disable output clock dividers auto power-down feature. It applies to M2, M3, and Mn dividers, where n is from 4 to 7. It depends on the available clock output dividers of the DPLL.	CM_DIV_M2_<DPLL name>[12] DPLL_M2_PWDN CM_DIV_M3_<DPLL name>[12] DPLL_CLKOUTHIF_PWDN CM_DIV_Mn_<DPLL name>[12] HSDIVIDER_CLKOUTn-3_PWDN	xx <sup>(3)</sup>

**Table 3-301. DPLL Output Clock Parameter Configuration (continued)**

Step	Register/Bit Field/Programming Model	Value
Enable/disable output clocks automatic gating feature. It applies to M2, M3, and Mn clock outputs, where n is from 4 to 7. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[8] DPLL_CLKOUT_GATE_CTRL CM_DIV_M3_<DPLL name>[8] DPLL_CLKOUTHIF_GATE_CTRL CM_DIV_Mn_<DPLL name>[8] HSDIVIDER_CLKOUTn-3_GATE_CTRL	xx <sup>(4)</sup>

- (1) It depends on the desired output clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).
- (2) It is toggled only if the programmed divider value differs from the previous one.
- (3) It depends on whether output clock divider automatic power down feature is to be enabled or not. See [Section 3.6.3.3.6, DPLL Output Power-Down](#).
- (4) It depends on whether output clock automatic gating feature is to be enabled or not.

### 3.10.1.2 DPLL Output Frequency Change

[Figure 3-75](#) shows the DPLL output-frequency change.

**Figure 3-75. DPLL Output-Frequency Change**

prcm-077

**Table 3-302. Register Call Summary for Sequence – DPLL Output Frequency Change**

Register Name
CM_CLKMODE_<DPLL name>

**Table 3-303. Subprocess Call Summary for Sequence – DPLL Output Frequency Change**

Subprocess Name	Cross-reference
Configure synthesized clock parameters	See <a href="#">Section 3.10.1.1.2.4.</a>
Configure output clocks parameters	See <a href="#">Section 3.10.1.1.2.5.</a>

### 3.10.2 Clock Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the clocks in the device.

#### 3.10.2.1 Global Initialization

##### 3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

[Table 3-304](#) shows the global initialization of the surrounding modules.

**Table 3-304. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLs managed by the PRCM module are initialized.

##### 3.10.2.1.2 Clock Management Global Initialization

###### 3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a power-on or software reset.

**Table 3-305. Clock Domain Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain	<Module name>_SYSCONFIG[x] MIDDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx <sup>(1)</sup>
Configure module clock-management feature of slave modules in the clock domain	See <a href="#">Section 3.10.3.3.</a>	
Enable/disable Static Sleep Dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP [x] <Destination Clock Domain name>_STATDEP	0x0 to Disable 0x1 to Enable
Set Dynamic Dependency window size	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx <sup>(2)</sup>
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ request>_<DMA/Processor name>	0x0 to disable 0x1 to enable
Set clock domain state transition feature	CM_<Clock Domain name>_CLKSTCTRL[1:0]11 CLKTRCTRL	xx <sup>(3)</sup>

- (1) See the module register for valid modes.
- (2) It depends on the desired size of the window. See [Section 3.1.1.1.7.2, Clock Domain Dependency](#).
- (3) It depends on the desired state of the clock domain. See [Table 3-11](#).

### 3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

**Table 3-306. Slave Module Clock-Management Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx <sup>(1)</sup>
<b>IF</b> : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x <sup>(1)</sup>
<b>ENDIF</b>		
Configure module management behavior on the PRCM module side	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx <sup>(2)</sup>

- (1) See the module register for valid settings.
- (2) The selected value depends on the desired clock-management behavior.

### 3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows to debug if the transition does not occur.

**Table 3-307. Clock Domain Sleep Transition and Troubleshooting**

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state	CM_<Clock Domain name>_CLKSTCTRL[1:0]11 CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
<b>IF</b> : Clock domain sleep transition not initiated?		
Check all clock domain master modules are in standby mode	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check all clock domain slave modules are in idle mode	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
<b>ENDIF</b>		

### 3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency use the procedure described in [Table 3-308](#).

**Table 3-308. Enable/Disable Software-Programmable Static Dependency**

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP)	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2
Wait until power domain which encloses the destination domain is ON	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency	CM_<Src_CDname>_STATICDEP[x] <Dest_CDname>_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO)	CM_<Dest_CDname >_CLKSTCTRL[1:0] CLKTRCTRL	0x3

### 3.10.3 Power Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and control of the power domain in the device.

#### 3.10.3.1 Global Initialization

##### 3.10.3.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

##### 3.10.3.1.2 Power Management Global Initialization

###### 3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a power-on or software reset.

**Table 3-309. Power Domain Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: Off 0x1: RETAINED 0x3: On
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x0: Off 0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x0: OSWR 0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

#### 3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

**Table 3-310. Forced Memory Area State Change With Power Domain ON**

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: OFF 0x1: RETAINED 0x3: ON
Wait until memory area state change is complete?	PM_<Power Domain name>_PWRSTCTRL[3] MEMORYCHANGE	0x0: Change complete
Get memory area current state	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x0: OFF 0x1: RETAINED 0x3: ON

#### 3.10.3.3 Forced Power Domain Low-Power State Transition

This procedure initiates a power state transition on a power domain from current low-power state (ON-INACTIVE or RETENTION) to a lower power state (RETENTION, OFF).

**Table 3-311. Forced Memory Area State Change With Power Domain On**

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: Off 0x1: Retention
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: Off 0x1: Retention

### 3.10.4 Voltage Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and management of the voltage domains of the device.

#### 3.10.4.1 Global Initialization

##### 3.10.4.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

##### 3.10.4.1.2 Voltage Management Global Initialization

###### 3.10.4.1.2.1 Main Sequence – Voltage Management Global Initialization and Setting

This procedure initializes the voltage management framework in the device.

**Table 3-312. Power Domain Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Initialize SmartReflex modules	See <a href="#">Section 3.10.4.1.3</a> .	
Initialize voltage processor modules	See <a href="#">Section 3.10.4.1.4</a> .	
Initialize voltage controller module	See <a href="#">Section 3.10.4.1.5</a> .	

##### 3.10.4.1.3 SmartReflex Module Initialization

This procedure initializes the SmartReflex module.

**Table 3-313. SmartReflex Module Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure clock	See <a href="#">Section 3.10.4.1.3.1</a> .	
Configure sensor	See <a href="#">Section 3.10.4.1.3.2</a> .	
Configure accumulator and min/max/avg	See <a href="#">Section 3.10.4.1.3.3</a> .	
Configure error generator	See <a href="#">Section 3.10.4.1.3.4</a> .	
Configure interrupt generator	See <a href="#">Section 3.10.4.1.3.5</a> .	
Enable module	SRn.SRCONFIG[11] SR_EN	0x1

###### 3.10.4.1.3.1 Subsequence – Clock Configuration

This procedure configures the clock for the SmartReflex module.

**Table 3-314. SmartReflex Module Clock Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure desired clock frequency	SRn.SRCONFIG[21:12] SRCLKLENGTH	xx <sup>(1)</sup>
Configure desired idle mode	SRn.ERRCONFIG[25:24] IDLEMODE	0x0: Forced-idle 0x1: No-idle 0x2: Smart-idle 0x3: Smart-idle Wakeup
Enable/disable wake-up feature	SRn.ERRCONFIG[26] WAKEUPENABLE	0x0: Disable 0x1: Enable
Enable clock	CM_ALWON_<SR name>_CLKCTRL[1:0] MODULEMODE	0x2: Enable

<sup>(1)</sup> See [Equation 1](#) for clock frequency calculation.

#### 3.10.4.1.3.2 Subsequence – Sensor Configuration

This procedure configures the sensor in the SmartReflex module.

**Table 3-315. SmartReflex Module Sensor Configuration**

Step	Register/Bit Field/Programming Model	Value
Enable sensor core A	SRn.SRCONFIG[1] SENENABLE	0x1
Enable sensor core B	SRn.SRCONFIG[0] SENPENABLE	0x1
Enable sensor core	SRn.SRCONFIG[10] SENENABLE	0x1

#### 3.10.4.1.3.3 Subsequence – Accumulator and Min/Max/Avg Configuration

This procedure configures the accumulator and min/max/avg part of the SmartReflex module.

**Table 3-316. Accumulator and Min/Max/Avg Configuration**

Step	Register/Bit Field/Programming Model	Value
Set size of the accumulator	SRn.SRCONFIG[31:22] ACCUMDATA	xxx <sup>(1)</sup>
Set average weight parameter for the sensor A	SRn.AVGWEIGHT[1:0] SENNAVGWEIGHT	x <sup>(1)</sup>
Set average weight parameter for the sensor B	SRn.AVGWEIGHT[3:2] SENPAVGWEIGHT	x <sup>(1)</sup>
Enable minimum/maximum/average	SRn.SRCONFIG[8] MINMAXAVGENABLE	0x1

<sup>(1)</sup> These parameters are calculated as given in [Section 3.8.3.2.3, SmartReflex Submodules](#).

#### 3.10.4.1.3.4 Subsequence – Error Generator Configuration

This procedure configures the error generator part of the SmartReflex module.

**Table 3-317. Error Generator Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure four reference value parameters	SRn.NVALUERECIPROCAL[23:20] SENPGAIN	x <sup>(1)</sup>
	SRn.NVALUERECIPROCAL[19:16] SENNGAIN	x <sup>(1)</sup>
	SRn.NVALUERECIPROCAL[15:8] SENPRN	xx <sup>(1)</sup>
	SRn.NVALUERECIPROCAL[7:0] SENNRN	xx <sup>(1)</sup>
Enable the error generator	SRn.SRCONFIG[9] ERRORGENERATORENABLE	0x1

<sup>(1)</sup> Configured according to the values read for the current operating voltage level from the control module register in [Section 3.8.3.2.3, SmartReflex Submodules](#).

#### 3.10.4.1.3.5 Subsequence – Interrupt Generator Configuration

This procedure configures the interrupt generator part of the SmartReflex module.

**Table 3-318. Interrupt Generator Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the four reference value parameters	SRn.ERRCONFIG[18:16] ERRWEIGHT	x
	SRn.ERRCONFIG[15:8] ERRMAXLIMIT	xx
	SRn.ERRCONFIG[7:0] ERRMINLIMIT	xx
<b>IF</b> : Automatic voltage control using voltage processor	Software test condition	
Clear voltage processor bounds interrupt status	SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Unmask voltage processor bounds interrupt	SRn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x1
<b>ELSE-IF</b> : Software-controlled voltage management	Software test condition	
Unmask <Processor> interrupt events	SRn.IRQENABLE_SET[3] MCUACCUMINTENASET	0x1
	SRn.IRQENABLE_SET[2] MCUVALIDINTENASET	0x1
	SRn.IRQENABLE_SET[1] MCUBOUNDSINTENASET	0x1
<b>ENDIF</b>		

#### 3.10.4.1.4 Voltage Processor Initialization

This procedure initializes the voltage processor.

**Table 3-319. Voltage Processor Module Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure error-to-voltage converter	See <a href="#">Section 3.10.4.1.4.1</a> .	
Configure PRCM	See <a href="#">Section 3.10.4.1.4.2</a> .	
Mask/unmask interrupt events	PRCM.PRM_IRQENABLE_<Processor name>	
Enable module	PRCM.PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x1

##### 3.10.4.1.4.1 Subsequence – Error-to-Voltage Converter Configuration

This procedure configures the error-to-voltage converter of the voltage processor.

**Table 3-320. Error-to-Voltage Converter Configuration**

Step	Register/Bit Field/Programming Model	Value
Set error offset	PRCM.PRM_<Voltage Processor name>_CONFIG[31:24] ERROROFFSET	xx <sup>(1)</sup>
Set error gain	PRCM.PRM_<Voltage Processor name>_CONFIG[23:16] ERRORGAIN	xx <sup>(1)</sup>
Set SMPS negative voltage step slew rate	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[23:8] SMPSWAITTIMEMIN	xx <sup>(1)</sup>
Set SMPS minimum voltage step size	PRCM.PRM_<Voltage Processor name>_VSTEPMIN[7:0] VSTEPMIN	xx <sup>(1)</sup>
Set SMPS positive voltage step slew rate	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[23:8] SMPSWAITTIMEMAX	xx <sup>(1)</sup>
Set SMPS maximum voltage step size	PRCM.PRM_<Voltage Processor name>_VSTEPMAX[7:0] VSTEPMAX	xx <sup>(1)</sup>
Set SMPS minimum voltage limit	PRCM.PRM_<Voltage Processor name>_VLIMITTO[23:16] VDDMIN	xx <sup>(1)</sup>
Set SMPS maximum voltage limit	PRCM.PRM_<Voltage Processor name>_VLIMITTO[31:24] VDDMAX	xx <sup>(1)</sup>

(1) Depend on the characteristics of the SMPS.

#### 3.10.4.1.4.2 Subsequence – FSM Configuration

This procedure configures the FSM of the voltage processor.

**Table 3-321. FSM Configuration**

Step	Register/Bit Field/Programming Model	Value
Set maximum length of time to wait for the command acknowledge from the SMPS	PRCM.PRM_<Voltage Processor name>_VLIMITTO[15:0] TIMEOUT	xxxx <sup>(1)</sup>
Set target initial voltage level of the SMPS	PRCM.PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	xx
Assert the initial voltage into the voltage processor FSM	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1

(1) Depend on the characteristics of the SMPS.

#### 3.10.4.1.5 Voltage Controller Initialization

This procedure initializes the voltage controller.

**Table 3-322. Voltage Controller Module Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure power IC slave addresses	PRCM.PRM_VC_SMPS_SA[x] SA_<Voltage Domain name>	xx <sup>(1)</sup>
Configure voltage configuration register addresses	PRCM.PRM_VC_VAL_SMPS_RA_VOL[x] VOLRA_<Voltage Domain name>	xx <sup>(1)</sup>
Configure command configuration register addresses	PRCM.PRM_VC_VAL_SMPS_RA_CMD[x] CMDRA_<Voltage Domain name>	xx <sup>(1)</sup>
Configure voltage domain command values	PRCM.PRM_VC_VAL_CMD_<Voltage Domain name>[x] <Command name>	xx <sup>(1)</sup>
Configure pointers for the VDD channels	See <a href="#">Section 3.10.4.1.5.1</a> .	
Configure I <sup>2</sup> C interface	See <a href="#">Section 3.10.4.1.5.2</a> .	

(1) Depend on the characteristics of the SMPS.

#### 3.10.4.1.5.1 Subsequence – VDD Channels Pointers Configuration

This procedure configures the FSM of the voltage processor.

**Table 3-323. VDD Channel Pointer Configuration**

Step	Register/Bit Field/Programming Model	Value
Set slave address pointer	PRCM.PRM_VC_CFG_CHANNEL[x] SA_<Voltage Domain name>	
Set voltage configuration register address pointer	PRCM.PRM_VC_CFG_CHANNEL[x] RAV_<Voltage Domain name>	
Set command configuration register address pointer	PRCM.PRM_VC_CFG_CHANNEL[x] RAC_<Voltage Domain name>	
Select voltage or command configuration register for FSM commands	PRCM.PRM_VC_CFG_CHANNEL[x] RACEN_<Voltage Domain name>	
Set command voltage level selection pointer	PRCM.PRM_VC_CFG_CHANNEL[x] CMD_<Voltage Domain name>	

(1) Depend on the connectivity characteristics of the SMPS.

#### 3.10.4.1.5.2 Subsequence – I<sup>2</sup>C Configuration

This procedure configures the I<sup>2</sup>C in the voltage controller.

**Table 3-324. I<sup>2</sup>C Configuration**

Step	Register/Bit Field/Programming Model	Value
Enable/disable I <sup>2</sup> C bus double digital filter	PRCM.PRM_VC_CFG_I2C_MODE[6] DFILTEREN	
Set master code value for I <sup>2</sup> C HS preamble	PRCM.PRM_VC_CFG_I2C_MODE[2:0] HSMCODE	
Enable/disable I <sup>2</sup> C HS mode	PRCM.PRM_VC_CFG_I2C_MODE[3] HSMODEEN	0x0: Disable 0x1: Enable
Enable/disable repeated start operation.	PRCM.PRM_VC_CFG_I2C_MODE[4] SRMODEEN	0x0: Disable 0x1: Enable

### 3.10.4.2 Changing OPP

This procedure allows changing of the voltage of the external SMPS from one OPP to the other. It also covers the programming sequence for ABB LDO if the OPP change requires a change in state of the ABB LDO.

**NOTE:** When switching from the current OPP to a target OPP, if the clock frequency of the target OPP is less than that of the current OPP, the clock frequency is first switched to the lower frequency of target OPP, and only then is the voltage scaling initiated. However, if the clock frequency of the target OPP is greater than that of the current OPP, voltage scaling is initiated before frequency scaling.

**Table 3-325. Changing OPP Using Voltage-Processor Module**

Step	Register/Bit Field/Programming Model	Value
Disable the SmartReflex module	SRn.SRCONFIG[11] SR_EN	0x0
Mask SmartReflex interrupts		
Disable the voltage processor module	PRCM.PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x0
Configured according to the target OPP voltage value	PRCM.PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	
<b>IF:</b> ABB LDO state change is necessary	Software test (See <a href="#">Section 3.8.4.3</a> )	
Set the desired state of the ABB LDO	PRCM.PRM_LDO_ABB_<MPU or DSP>_SETUP[x] ACTIVE_RBB_SEL or ACTIVE_FBB_SEL	0x0/0x1
Enable/bypass the ABB power management of the ABB LDO	PRCM.PRM_LDO_ABB_<MPU or DSP>_SETUP[x] SR2EN	0x0/0x1
Select the next OPP for the ABB LDO	PRM_LDO_ABB_<MPU or DSP>_CTRL[1:0] OPP_SEL	
Initiate the state change for the ABB LDO	PRM_LDO_ABB_<MPU or DSP>_CTRL[2] OPP_CHANGE	0x1
Wait until ABB LDO state transition completes	PRM_LDO_ABB_<MPU or DSP>_CTRL[6] SR2_IN_TRANSITION	0x0
<b>ENDIF</b>		
Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1
Force update of the SMPS	PRCM.PRM_<Voltage Processor name>_CONFIG[1] FORCEUPDATE	0x1

## 3.11 PRCM Register Manual

### 3.11.1 PRM Instance Summary

**Table 3-326. PRM Instance Summary**

Module Name	L4 Base Address	Size
INTRCONN_SOCKET_PRM	0x4A30 6000	256Bytes
CKGEN_PRM	0x4A30 6100	256Bytes
MPU_PRM	0x4A30 6300	256Bytes

Bits	Field Name	Description	Type	Reset
31	ABB_IVA_DONE_ST	IVA ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_LDO_ABB_IVA_CRTL register. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
30	VC_IVA_VPACK_ST	Voltage Controller IVA voltage processor command acknowledge status.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
29	VP_IVA_TRANXDONE_ST	Voltage Processor IVA transaction completion status. This status is set when a transaction is completed in the voltage processor, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CTRL). It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
28	VP_IVA_EQVALUE_ST	Voltage Processor IVA voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
27	VP_IVA_NOSMPSACK_ST	Voltage Processor IVA timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
26	VP_IVA_MAXVDD_ST	Voltage Processor IVA voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
25	VP_IVA_MINVDD_ST	Voltage Processor IVA voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
24	VP_IVA_OPPCHANGEDONE_ST	Voltage Processor IVA OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CTRL). It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
23	RESERVED		R	0
22	VC_CORE_VPACK_ST	Voltage Controller CORE voltage processor command acknowledge status  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
21	VP_CORE_TRANXDONE_ST	Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
20	VP_CORE_EQVALUE_ST	Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
19	VP_CORE_NOSMPSACK_ST	Voltage Processor CORE timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software.  0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
18	VP_CORE_MAXVDD_ST	Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
17	VP_CORE_MINVDD_ST	Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
16	VP_CORE_OPPCHANGEDONE_ST	Voltage Processor CORE OPP change done status. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
15	Reserved		R	0
14	VC_BYPASSACK_ST	Voltage Controller bypass command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

## 3.11.11.2 DSS\_PRM Register Description

Table 3-519. PM\_DSS\_PWRSTCTRL

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	DSS_PRM
<b>Physical Address</b>	See <a href="#">Table 3-518</a>		
<b>Description</b>	This register controls the DSS power state to reach upon a domain sleep transition		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
RESERVED																DSS_MEM_ONSTATE		RESERVED						DSS_MEM_RETSTATE		RESERVED		LOWPOWERSTATECHANGE		RESERVED		LOGICRETSTATE		POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	DSS_MEM_ONSTATE	DSS_MEM state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
15:9	RESERVED		R	0x00
8	DSS_MEM_RETSTATE	DSS_MEM state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION Read 0x0: Whole logic is off when the domain is in RETENTION state.	R	0
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

**3.11.13.2 L3INIT\_PRM Register Description****Table 3-535. PM\_L3INIT\_PWRSTCTRL**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	L3INIT_PRM
<b>Physical Address</b>	See <a href="#">Table 3-534</a>		
<b>Description</b>	This register controls the L3INIT power state to reach upon a domain sleep transition		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								RESERVED								RESERVED								RESERVED	LOWPOWERSTATECHANGE	RESERVED	LOGICRETSTATE	POWERSTATE			
								L3INIT_BANK1_ONSTATE																L3INIT_BANK1_RETSTATE							

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	L3INIT_BANK1_ONSTATE	L3INIT BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
15:9	RESERVED		R	0x00
8	L3INIT_BANK1_RETSTATE	L3INIT BANK1 state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remain logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

**3.11.14.2 L4PER\_PRM Register Description**

**Table 3-572. PM\_L4PER\_PWRSTCTRL**

<b>Address Offset</b>	0x0000 0000		
<b>Physical Address</b>	See <a href="#">Table 3-571</a>	<b>Instance</b>	L4PER_PRM
<b>Description</b>	This register controls the L4PER power state to reach upon a domain sleep transition		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								NONRETAINED_BANK_ONSTATE		RETAINED_BANK_ONSTATE		RESERVED						NONRETAINED_BANK_RETSTATE		RETAINED_BANK_RETSTATE		RESERVED		LOWPOWERSTATECHANGE		RESERVED		LOGICRETSTATE		POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x000
19:18	NONRETAINED_BANK_ONSTATE	NONRETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
17:16	RETAINED_BANK_ONSTATE	RETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
15:10	RESERVED		R	0x00
9	NONRETAINED_BANK_RETSTATE	NONRETAINED_BANK state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
8	RETAINED_BANK_RETSTATE	RETAINED_BANK state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R Rreturns 1s	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x3

3.11.16.2 WKUP\_CM Register Description

Table 3-718. CM\_WKUP\_CLKSTCTRL

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	WKUP_CM
<b>Physical Address</b>	See Table 3-717		
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_L4_WKUP_ICLK	CLKACTIVITY_WKUP_32K_FCLK	RESERVED	CLKACTIVITY_ABE_LP_CLK	CLKACTIVITY_SYS_CLK	RESERVED						CLKTRCTRL				

Bits	Field Name	Description	Type	Reset
31:13	RESERVED		R	0x00000
12	CLKACTIVITY_L4_WKUP_ICLK	This field indicates the state of the clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
11	CLKACTIVITY_WKUP_32K_FCLK	This field indicates the state of the clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
10	RESERVED		R	0
9	CLKACTIVITY_ABE_LP_CLK	This field indicates the state of the clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
8	CLKACTIVITY_SYS_CLK	This field indicates the state of the SYS_CLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
7:2	RESERVED		R	0x00

Bits	Field Name	Description	Type	Reset
1:0	CLKTRCTRL	Controls the clock state transition of the WKUP clock domain.  0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur.  Read 0x1: Reserved  Read 0x2: Reserved  0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

**Table 3-720. CM\_WKUP\_L4WKUP\_CLKCTRL**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	WKUP_CM
<b>Physical Address</b>	See <a href="#">Table 3-717</a>		
<b>Description</b>	This register manages the L4WKUP clocks.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								IDLEST	RESERVED								MODULEMODE														

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive]  Read 0x0: Module is fully functional, including INTRCONN  Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion  Read 0x2: Module is in idle mode (only INTRCONN part). It is functional if using separate functional clock  Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000
1:0	MODULEMODE	Control the way mandatory clocks are managed.  Read 0x1: Module is managed automatically by hardware according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any INTRCONN access to module is always granted. Module clocks may be gated according to the clock domain state.	R Rreturns	0x1

<b>Address Offset</b>	0x0000 0020
<b>Physical Address</b>	See <a href="#">Table 3-750</a>
<b>Description</b>	This register allows overriding ISOCLK signal towards I/O pad ring.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								GLOBAL_WUEN	RESERVED								WUCLK_STATUS		WUCLK_CTRL		RESERVED								ISOCLK_STATUS		ISOCLK_OVERRIDE

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0000
16	GLOBAL_WUEN	Global I/O wakeup enable. This is a gating condition to all individual I/O WUEN coming from control module. Gating is done in the Spinner logic.  0x0: All individual I/O WUEN are gated in the Spinner logic (overridden to 0).  0x1: All individual I/O WUEN from control module are going to IOs.	RW	0
15:10	RESERVED		R	0x00
9	WUCLK_STATUS	Gives value of WUCLKOUT signal coming back from I/O pad ring.	R	0
8	WUCLK_CTRL	Direct control on WUCLKIN signal to I/O pad ring.  0x0: WUCLKIN signal is driven to 0. I/O wakeup daisy chain is functional as well as I/O whose wakeup feature is enabled.  0x1: WUCLKIN signal is driven to 1. I/O wakeup daisy chain is reset and is latching current pad states and WUEN inputs.	RW	0
7:6	RESERVED		R	0x0
5	IOON_STATUS	Gives the functional status of the I/O ring.  Read 0x0: Part or all of the IOs are not in the ON state, that is are in isolation state  Read 0x1: All IOs are in the ON state	R	1
4	ISOOVR_EXTEND	Control non-EMIF I/O isolation extension upon a device wakeup from OFF mode.  0x0: Non-EMIF I/O isolation is not extended. "EMIF_ON" I/O transition happens as soon as automatic restore is completed  0x1: Non-EMIF I/O isolation is extended. "EMIF_ON" I/O transition is stalled	RW	0
3:2	RESERVED		R	0x0
1	ISOCLK_STATUS	Gives value of ISOCLKOUT signal coming back from I/O pad ring.	R	0
0	ISOCLK_OVERRIDE	Override control on ISOCLKIN signal to I/O pad ring. Override should be used at boot time only when it is needed to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled by hardware only.  0x0: ISOCLKIN signal is not overridden.  0x1: ISOCLKIN signal is overridden to active value (1).	RW	0

<b>Address Offset</b>	0x0000 0024	<b>Instance</b>	DEVICE_PRM
<b>Physical Address</b>	See <a href="#">Table 3-750</a>		
<b>Description</b>	This register provides bit fields for specifying voltage ramp-up and ramp-down times for PRM managed external regulators. These values are used for VDD_CORE_L domain transitions with OFF state. [warm reset insensitive]		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STABLE_PRESCAL		RESERVED		STABLE_COUNT											

Bits	Field Name	Description	Type	Reset
31:10	RESERVED		R	0x000000
9:8	STABLE_PRESCAL	Determines prescaler for stabilization duration counting. 0x0: Ramp-up counter is incremented every 32 system clock cycles 0x1: Ramp-up counter is incremented every 256 system clock cycles 0x2: Ramp-up counter is incremented every 2048 system clock cycles 0x3: Ramp-up counter is incremented every 16384 system clock cycles	RW	0x0
7:6	RESERVED		R	0x0
5:0	STABLE_COUNT	Determines the stabilization duration of all VDD_xxx_L regulators upon a global warm reset assertion. The duration is computed according to Stable_Prescal.	RW	0x00

<b>Description</b>	This register provides controls over the DPLL.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								DPLL_BYP_CLKSEL	RESERVED	DPLL_CLKOUTHIF_CLKSEL	RESERVED	DPLL_MULT								RESERVED	DPLL_DIV										

Bits	Field Name	Description	Type	Reset
31:24	RESERVED		R	0x00
23	DPLL_BYP_CLKSEL	Allows control of the BYPASS clock of the PLL and the associated HSDIVIDER. Same as ULOWCLKEN on DPLL. In DPLL locked mode, 0 - No impact 1 - No impact In DPLL bypass mode, 0 - CLKINP is selected as the BYPASS clock for CLKOUT/CLKOUTX2 1 - CLKINPULOW is selected as the BYPASS clock for CLKOUT/CLKOUTX2	RW	0
22:21	RESERVED		R	0x0

Bits	Field Name	Description	Type	Reset
20	DPLL_CLKOUTHIF_CLKSEL	Selects the source of the DPLL CLKOUTHIF clock. Same as CLKINPHIFSEL pin on the DPLL  0x0: CLKOUTHIF is generated from the DPLL oscillator (DCO)  0x1: CLKOUTHIF is generated from CLKINPHIF	RW	0
19	RESERVED		R	0
18:8	DPLL_MULT	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN bypass mode. (equal to input M of DPLL; M=2 to 2047 => DPLL multiplies by M).  0x0: Reserved  0x1: Reserved	RW	0x000
7	RESERVED		R	0
6:0	DPLL_DIV	DPLL divider factor (0 to 127) (equal to input N of DPLL; actual division factor is N+1).	RW	0x00

DCC_COUNT_MAX								DPLL_BYP_CLKSEL	DCC_EN				DPLL_MULT							RESERVED	DPLL_DIV										

Bits	Field Name	Description	Type	Reset
31:24	DCC_COUNT_MAX	The value "NbCycles" set in this field determines the duration of the clock ramp step during which the output frequency is $F_{dpll}/(2 \cdot M^2)$ . The duration is computed as $32 \times \text{NbCycles}$ of L4 clock cycles (100 MHz). Duration should be $> 1.5 \mu\text{s}$ to allow enough time for DCC to lock. This bit field is relevant only when DCC_EN = 1.	RW	0x05
23	DPLL_BYP_CLKSEL	Only CLKINPULOW bypass clock supported for this PLL	R Returns 1s	1
22:19	DCC_EN	Enable or disable duty cycle correction. Must be enabled only for frequency $> 1 \text{ GHz}$ .  When enabled, the CLKOUTHIF output of the DPLL is used after duty cycle correction instead of CLKOUT. The M3 divider is hard-wired to 1 so the lock frequency $F_{dpll}$ is directly provided to MPU.  0x0: DCC disabled 0x1: DCC enabled	RW	0x0
18:8	DPLL_MULT	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN bypass mode. (equal to input M of DPLL; $M=2$ to 2047 $\Rightarrow$ DPLL multiplies by M).  0x0: Reserved 0x1: Reserved	RW	0x000
7	RESERVED		R	0
6:0	DPLL_DIV	DPLL divider factor (0 to 127) (equal to input N of DPLL; actual division factor is $N+1$ ).	RW	0x00

#### 3.11.37.2 SGX\_CM2 Register Description

**Table 3-1279. CM\_SGX\_CLKSTCTRL**

<b>Address Offset</b>	0x0000 0000		
<b>Physical Address</b>	See <a href="#">Table 3-1278</a>	<b>Instance</b>	SGX_CM2
<b>Description</b>	This register enables the SGX domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_SGX_FCLK		CLKACTIVITY_SGX_L3_ICLK		RESERVED										CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:10	RESERVED		R	0x000000
9	CLKACTIVITY_SGX_FCLK	This field indicates the state of the SGX_FCLK clock in the domain. [warm reset insensitive]  Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
8	CLKACTIVITY_SGX_L3_ICLK	This field indicates the state of the SGX_L3_ICLK clock in the domain. [warm reset insensitive]  Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the SGX clock domain.  0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur.  0x1: SW_SLEEP: Start a software forced sleep transition on the domain.  0x2: SW_WKUP: Start a software forced wake-up transition on the domain.  0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x3

**3.11.39.2 L4PER\_CM2 Register Description****Table 3-1313. CM\_L4PER\_CLKSTCTRL**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	L4PER_CM2
<b>Physical Address</b>	See <a href="#">Table 3-1312</a>		
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLKACTIVITY_PER_ABE_24M_FCLK	RESERVED	RESERVED	CLKACTIVITY_PER_MCBSP4_FCLK	RESERVED	CLKACTIVITY_PER_96M_FCLK	CLKACTIVITY_PER_48M_FCLK	CLKACTIVITY_PER_32K_FCLK	CLKACTIVITY_PER_24MC_FCLK	CLKACTIVITY_12M_FCLK_FCLK	CLKACTIVITY_GPT9_FCLK	CLKACTIVITY_GPT4_FCLK	CLKACTIVITY_GPT3_FCLK	CLKACTIVITY_GPT2_FCLK	CLKACTIVITY_GPT11_FCLK	CLKACTIVITY_GPT10_FCLK	CLKACTIVITY_L4_PER_ICLK	RESERVED					CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25	CLKACTIVITY_PER_ABE_24M_FCLK	This field indicates the state of the PER_ABE_24M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
24	RESERVED		R	0
23	RESERVED		R	0
22	CLKACTIVITY_PER_MCBSP4_FCLK	This field indicates the state of the PER_MCBSP4_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
21:20	RESERVED		R	0
19	CLKACTIVITY_PER_96M_FCLK	This field indicates the state of the PER_96M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
18	CLKACTIVITY_PER_48M_FCLK	This field indicates the state of the PER_48M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
17	CLKACTIVITY_PER_32K_FCLK	This field indicates the state of the PER_32K_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
16	CLKACTIVITY_PER_24MC_FCLK	This field indicates the state of the PER_24MC_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
15	CLKACTIVITY_12M_FCLK	This field indicates the state of the FUNC_12M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0

Bits	Field Name	Description	Type	Reset
14	CLKACTIVITY_GPT9_FCLK	This field indicates the state of the DMT9_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
13	CLKACTIVITY_GPT4_FCLK	This field indicates the state of the DMT4_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
12	CLKACTIVITY_GPT3_FCLK	This field indicates the state of the DMT3_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
11	CLKACTIVITY_GPT2_FCLK	This field indicates the state of the DMT2_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
10	CLKACTIVITY_GPT11_FCLK	This field indicates the state of the DMT11_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
9	CLKACTIVITY_GPT10_FCLK	This field indicates the state of the DMT10_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
8	CLKACTIVITY_L4_PER_ICLK	This field indicates the state of the L4_PER_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the L4PER clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000

Bits	Field Name	Description	Type	Reset
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by software. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved	RW	0x0
